Principles and Practice of X-Ray Spectrometric Analysis E.P. Bertin, 2012-12-06 Since the first edition of this book was published early in 1970 three major developments have occurred in the field of x ray spectrochemical analysis First wavelength dispersive spectrometry in 1970 already securely established among instrumental analytical methods has matured Highly sophisticated miniaturized modular solid state circuitry has replaced electron tube circuitry in the readout system Computers are now widely used to program and control fully automated spectrometers and to store process and compute analytical concentrations directly and immediately from accumulated count data Matrix effects have largely yielded to mathematical treatment The problems associated with the ultralong wavelength region have been largely surmounted Indirect association methods have extended the applicability of x ray spectrometry to the entire periodic table and even to certain classes of compounds Modern commercial computerized automatic simultaneous x ray spectrometers can index up to 60 specimens in turn into the measurement position and for each collect count data for up to 30 elements and read out the analytical results in 1.4 min all corrected for absorption enhancement and particle size or surface texture effects and wholly unattended Sample preparation has long been the time limiting step in x ray spectrochemical analysis Second energy dispersive spectrometry in 1970 only beginning to assume its place among instrumental analytical methods has undergone phenomenal development and application and some believe may supplant wavelength spectrometry for most applications in the foreseeable future
