**Tectonic Growth of a Collisional Continental Margin** Kenneth D. Ridgway,2007 The convergent margin

of southern Alaska is considered one of the type areas for understanding the growth of continental margins through collisional tectonic processes. Collisional processes that formed this margin were responsible for multiple episodes of sedimentary basin development, subduction, complex growth, magmatism, and deformation. Two main collisional episodes shaped this Mesozoic-Cenozoic continental margin. The first event was the Mesozoic collision of the allochthonous Wrangellia composite terrane. This event represents the largest addition of juvenile crust to western North America in the past 100 m.y. The second event is the ongoing collision of the Yakutat terrane along the southeastern margin of Alaska. This Cenozoic event has produced the highest coast mountain range on Earth, Saint Elias Mountains, the Wrangell continental arc, and sedimentary basins throughout southern Alaska. Active collisional processes continue to shape the southern margin of Alaska mainly through crustal shortening and strike-slip deformation, large magnitude earthquakes, and rapid uplift and exhumation of mountain belts and high sedimentation rates in adjacent sedimentary basins. This volume contains 24 articles that integrate new geophysical and geologic data, including many field-based studies, to better link the sedimentary, structural, geochemical, and magmatic processes that are important for understanding the development of collisional continental margins. *Resources in Education*, 1991. Serves as an index to Eric reports, microform. *Radiological Risk Assessment and Environmental Analysis*, John E. Till, Helen A. Grogan, 2008-07-10. Radiological Risk Assessment and Environmental Analysis comprehensively explains methods used for estimating risk to people exposed to radioactive materials released to the environment by nuclear facilities or in an emergency such as a nuclear terrorist event. This is the first book that merges the diverse disciplines necessary for estimating where radioactive materials go in the environment and the risk they present to people. It is not only essential to managers and scientists but is also a teaching text. The chapters are arranged to guide the reader through the risk assessment process, beginning with the source term where the radioactive material comes from and ending with the conversion to risk. In addition to presenting mathematical models used in risk assessment, data is included so the reader can perform the calculations. Each chapter also provides examples and working problems. The book will be a critical component of the rebirth of nuclear energy now taking place as well as an essential resource to prepare for and respond to a nuclear emergency. **Geology of the North Cascades**, Rowland Tabor, Ralph Haugerud, 1999-05-31. Explains the geologic natural history of the North Cascades. Appeals to hikers who are fascinated by the region as well as amateur geologists. Authors are both geologists with the US Geological Survey. Composed of everything from volcanic island arcs and deep ocean sediments to parts of old continents and even pieces of the deep subcrustal mantle of the earth. Washington's North Cascade region is a true geologic mosaic. Here authors Tabor and Haugerud reveal that the spectacular scenery of these mountains is matched by equally spectacular geology. Beginning with a summary of the geologic history of the North Cascades, the first section also offers the novice a primer on geologic terms and processes. The second section covers more

than 150 accessible sites of geologic interest arranged by reference to the rivers and streams of the range Many new ideas about the rocks and geologic processes in the North Cascades are introduced making this a must read for those studying the region
