

Question 1: Slinky Waves

The dispersion relation for a transverse wave in a stiff, rectangular cross section wire is given by

$$\omega^2 = k^2 \frac{T}{\mu} + \frac{c^2 d^2}{12} k^4$$

where c is the speed of longitudinal compression waves in the wire (i.e. sound waves) and d is the transverse width of the wire (in metres). In a slinky, to good approximation we can use the limit where $T \rightarrow 0$.

The slinky in the lecture is made of steel with a rectangular cross section. The transverse widths are $x=2\text{mm}$ and $y=0.75\text{mm}$, giving 2 different dispersion relations depending on which way the transverse wave is oriented.

- What are the phase and group velocities of the transverse waves as a function of frequency f (in Hz)?
- When compressed, the slinky in the lecture is 10.5cm tall and a diameter of 7cm. Find equations for travel time of narrow-band wave-packets with a centre frequency of f (Hz) for excitations in the x and y dimensions.
- Assume the slinky is hit with a sharp blow at one end so that transverse waves are excited in the x direction only. What is the equation for the motion of the slinky at the far end? (You do not need an analytic expression, just the integral).
