Levy, Gila Morgenstern, 2012-10-22 This book constitutes the thoroughly refereed proceedings of the 38th International Workshop on Graph Theoretic Concepts in Computer Science WG 2012 held in Jerusalem Israel on June 26-28, 2012. The 29 revised full papers presented were carefully selected and reviewed from 78 submissions. The papers are solicited describing original results on all aspects of graph theoretic concepts in Computer Science: e.g. structural graph theory, sequential, parallel, randomized, parameterized and distributed graph and network algorithms and their complexity, graph grammars and graph rewriting systems, graph based modeling, graph drawing and layout, random graphs, diagram methods and support of these concepts by suitable implementations. The scope of WG includes all applications of graph theoretic concepts in Computer Science including data structures, data bases, programming languages, computational geometry, tools for software construction, communications, computing on the web, models of the web and scale free networks, mobile computing, concurrency, computer architectures, VLSI, artificial intelligence, graphics, CAD, operations research and pattern recognition.

Topics in Combinatorics and Graph Theory R. Rama, 2025-07-01 The book covers all the basics of both the topics. The topics are sequenced in such a manner that there is a flow in understanding the advances. The first and second chapters cover all the basic methods and tools for counting. Chapter 3 is on binomial theorem and binomial identities. Topics such as partitions, permutations on multisets, generating functions, recurrence relation, principle of inclusion-exclusion, repeated counting, partially ordered sets and Mobius inversion, Polya's counting are covered in different chapters. Some basic chapters have some worked-out exercises. Information on Catalan numbers, Eulerian Numbers, Narayana Numbers and Schroder Number are given in a chapter. The topic on discrete probability covers the connection between counting techniques and probability theory. The second part of the book covers topics in graph theory such as basics of graphs, trees, bipartite graphs, matching, planar graphs, Euler and Hamilton graphs, graph coloring, Ramsey theory, spectral properties and some graph algorithms. Adequate exercise and examples are provided so as to enhance the reader's interest and understanding. Some interesting concepts like high hamiltonicity, power of graphs, domination and matrix tree theorem are introduced. *Rainbow Connections of Graphs* Xueliang Li, Yuefang Sun, 2012-02-23 Rainbow connections are natural combinatorial measures that are used in applications to secure the transfer of classified information between agencies in communication networks. *Rainbow Connections of Graphs* covers this new and emerging topic in graph theory and brings together a majority of the results that deal with the concept of rainbow connections first introduced by Chartrand et al. in 2006. The authors begin with an introduction to rainbow connectedness, rainbow coloring and rainbow connection number. The work is organized into the following categories: computation of the exact values of the rainbow connection numbers for some special graphs, algorithms and complexity analysis, upper bounds in terms of other graph parameters, rainbow connection for dense and sparse graphs for some graph classes and graph products, rainbow k -connectivity and k -rainbow index and rainbow vertex connection number. *Rainbow Connections of Graphs* appeals to researchers and graduate students in the field of graph theory.

Conjectures open problems and questions are given throughout the text with the hope for motivating young graph theorists and graduate students to do further study in this subject
