Principles of

Petroleum Reservoir Engineering Gian L. Chierici, 2012-12-06 Volume 1 of this book dealt with the techniques behind the

acquisition processing and interpretation of basic reservoir data This second volume is devoted to the study verification and prediction of reservoir behaviour and methods of increasing productivity and oil recovery I should like to bring a few points to the reader's attention Firstly the treatment of immiscible displacement by the method of characteristics The advantage of this approach is that it brings into evidence the various physical aspects of the process especially its dependence on the properties of the fluids concerned and on the velocity of displacement It was not until after the publication of the first Italian edition of this book February 1990 that I discovered a similar treatment in the book Enhanced Oil Recovery by Larry W Lake published in 1989 Another topic that I should like to bring to the reader's attention is the forecasting of reservoir behaviour by the method of identified models This original contribution to reservoir engineering is based on systems theory a science which should in my opinion find far wider application in view of the black box nature of reservoirs and their responses to production processes

Nonlinear Diffusion Equations and Their Equilibrium States II W.-M. Ni, L.A. Peletier, James Serrin, 1988-06-24 In recent years considerable interest has been focused on nonlinear diffusion problems the archetypical equation for these being $U_t = U \Delta u$ Here Δ denotes the n dimensional Laplacian the solution $u(x, t)$ is defined over some space time domain of the form $[0, \infty) \times \Omega$ and $f(u)$ is a given real function whose form is determined by various physical and mathematical applications These applications have become more varied and widespread as problem after problem has been shown to lead to an equation of this type or to its time independent counterpart the elliptic equation of equilibrium $U \Delta u = 0$ Particular cases arise for example in population genetics the physics of nuclear stability phase transitions between liquids and gases flows in porous media the Lend Emden equation of astrophysics various simplified combustion models and in determining metrics which realize given scalar or Gaussian curvatures In the latter direction for example the problem of finding conformal metrics with prescribed curvature leads to a ground state problem involving critical exponents Thus not only analysts but geometers as well can find common ground in the present work The corresponding mathematical problem is to determine how the structure of the nonlinear function $f(u)$ influences the behavior of the solution

Numerical Verification Methods and Computer-Assisted Proofs for Partial Differential Equations Mitsuhiro T. Nakao, Michael Plum, Yoshitaka Watanabe, 2019-11-11 In the last decades various mathematical problems have been solved by computer assisted proofs among them the Kepler conjecture the existence of chaos the existence of the Lorenz attractor the famous four color problem and more In many cases computer assisted proofs have the remarkable advantage compared with a theoretical proof of additionally providing accurate quantitative information The authors have been working more than a quarter century to establish methods for the verified computation of solutions for partial differential equations mainly for nonlinear elliptic problems of the form $U \Delta u = f(x, u)$ with Dirichlet boundary conditions Here by verified computation is meant a computer assisted numerical approach for proving the existence of a solution in a close and explicit neighborhood of an approximate solution The quantitative information provided by these techniques is also significant from the viewpoint of a

posteriori error estimates for approximate solutions of the concerned partial differential equations in a mathematically rigorous sense In this monograph the authors give a detailed description of the verified computations and computer assisted proofs for partial differential equations that they developed In Part I the methods mainly studied by the authors Nakao and Watanabe are presented These methods are based on a finite dimensional projection and constructive a priori error estimates for finite element approximations of the Poisson equation In Part II the computer assisted approaches via eigenvalue bounds developed by the author Plum are explained in detail The main task of this method consists of establishing eigenvalue bounds for the linearization of the corresponding nonlinear problem at the computed approximate solution Some brief remarks on other approaches are also given in Part III Each method in Parts I and II is accompanied by appropriate numerical examples that confirm the actual usefulness of the authors methods Also in some examples practical computer algorithms are supplied so that readers can easily implement the verification programs by themselves
