Handbook of Adolescent Health Psychology William T. O'Donohue,Lorraine T. Benuto,Lauren Woodward Tolle,2014-07-08 Adolescence is a pivotal period of development with respect to health and illness It is during adolescence that many positive health behaviors are consolidated and important health risk behaviors are first evident thus adolescence is a logical time period for

primary prevention In addition the predominant causes of morbidity and mortality in adolescence are quite different from those of adults indicating that early identification and treatment of adolescent health problems must be directed to a unique set of targets in this age group Moreover because of the particular developmental issues that characterize adolescence intervention efforts designed for adults are often inappropriate or ineffective in an adolescent population Even when chronic illnesses are congenital or begin in childhood the manner in which the transition from childhood to adolescence to young adulthood is negotiated has important implications for disease outcomes throughout the remainder of the person's life span
