**Crustacean Reproductive Physiology and its Applications** Haihui Ye, Chaoshu Zeng, Naoaki Tsutsui, Heinrich Dirksen, 2022-09-27 Demand for crustacean production is increasing significantly throughout the world and crustacean production from capture fisheries has almost stagnated Aquaculture is the only possibility to meet this ever growing demand for crustaceans Still many commercially important crustaceans are being captured from the wild while breeding and seed production technologies are not available for these species The bottleneck in the successful breeding of crustacean species is mainly due to the non availability of information about reproductive biology Studies on crustacean reproduction will shed new light on understanding the mechanism of sex determination and differentiation meanwhile the application of innovative techniques will vitally contribute to the progress of the crustacean industry The research findings on crustacean reproduction will directly benefit aquaculture for successful captive breeding and seed production Here we are gathering both original research and review papers with the scope of the research topic including but not limited to Mechanism of sex determination sexual differentiation and gonadal development in crustaceans Other life functions e g endocrine nutrition immunity heredity involved in reproduction in crustaceans Applications of modern endocrinological and molecular

**Control Mechanisms in the Nervous System** Abel Lajtha, 2013-04-17 The explosive accumulation of new knowledge in the biological sciences in the last decades has advanced our understanding of the basic mechanisms that underlie most biological phenomena. These advances however have not been uniform but have varied considerably among the different biological problems. In some cases e.g. biochemical genetics radical advances have been made which have changed our ideas and our approaches. In other cases even with work which has yielded much detailed new knowledge our understanding of basic mechanisms remains very inadequate. Among the lines of work that have not yet led to dramatic conceptual advances is the problem of control of biological activities. This problem is of course basic both to any full understanding of life as a whole and to any real understanding of its most minute phenomena. Indeed the myriad of biological activities that we can observe by direct or indirect means are all under the sway of most exquisitely precise mechanisms. Any malfunctioning of these mechanisms has serious consequences not only for the particular function itself but for all the related and interlinked activities.

*Biological Emergences* Robert G. B. Reid, 2009-08-21 A critique of selectionism and the proposal of an alternate theory of emergent evolution that is causally sufficient for evolutionary biology. Natural selection is commonly interpreted as the fundamental mechanism of evolution. Questions about how selection theory can claim to be the all sufficient explanation of evolution often go unanswered by today's neo Darwinists perhaps for fear that any criticism of the evolutionary paradigm will encourage creationists and proponents of intelligent design. In *Biological Emergences* Robert Reid argues that natural selection is not the cause of evolution. He writes that the causes of variations which he refers to as natural experiments are independent of natural selection indeed he suggests natural selection may get in the way of evolution. Reid proposes an alternative theory to explain how emergent novelties are generated and under what conditions they can overcome the resistance of natural selection. He suggests that what causes innovative variation causes evolution and that these phenomena are environmental as well as organismal. After an extended critique of selectionism Reid constructs an emergence theory of evolution first examining the evidence in three causal arenas of emergent evolution symbiosis association evolutionary physiology behavior and developmental evolution. Based on this evidence of causation he proposes some working hypotheses examining mechanisms and processes common to all three arenas and arrives at a theoretical framework that accounts for generative mechanisms and emergent qualities. Without selectionism Reid argues evolutionary innovation can more easily be integrated into a general thesis. Finally Reid proposes a biological synthesis of rapid emergent evolutionary phases and the prolonged dynamically stable non evolutionary phases imposed by natural selection.
