

Lesson 1: Ground shaking

- **DYFI** is an earthquake hazards program by the United States Geological Survey. It stands for Did You Feel It? It is a system that collects information on earthquakes' effects and damages. The DYFI data and reports are used and applied in scientific studies. Users and responders may visit its product page to view intensity maps, tables of responses, and studies on the relationship of variables. It is an upscaling of analytics through data collection on earthquake experiences.

The Concept of Earthquake

- An **earthquake** is caused by the sudden and rapid movement of large volumes of rock along fractures on the earth's surface called **faults**. The earth's outermost shell, crust, and uppermost mantle consist of moving **tectonic plates**. The movement causes friction. To overcome this movement, the plates separate, and the energy stored in the rocks is released as **seismic waves**.
- Teacher's script: "Türkiye is situated on the Anatolian plate and shares its border with Northern Syria, which sits on the Arabian plate. The Eurasian plate and the Arabian plate push against the smaller Anatolian plate. The fault system between the two countries is a transform boundary. It is considered to be one of the most active fault systems that caused the 7.8 magnitude earthquake last February 6, 2023."

Types of Seismic Waves

- P-waves and S-waves are seismic waves that move through the earth's interior. On the other hand, Love waves and Rayleigh waves are surface waves. P-waves push and pull. S-waves move the ground up and down. Love waves resemble snakes. Rayleigh's waves roll. Seismic waves move and shake the ground.

The severity of an earthquake is measured based on:

- Magnitude – measures the energy released by an earthquake.
- Intensity – measures the effect of the earthquake on people and man-made structures.
