

## Chapter 53: Assessment of Kidney and Urinary Function

1. The care team is considering the use of dialysis in a patient whose renal function is progressively declining. Renal replacement therapy is indicated in which of the following situations?

- A) When the patient's creatinine level drops below 1.2 mg/dL (110 mmol/L)
- B) When the patient's blood urea nitrogen (BUN) is above 15 mg/dL
- C) When approximately 40% of nephrons are not functioning
- D) When about 80% of the nephrons are no longer functioning

Ans: D

### Feedback:

When the total number of functioning nephrons is less than 20%, renal replacement therapy needs to be considered. Dialysis is an example of a renal replacement therapy. Prior to the loss of about 80% of the nephron functioning ability, the patient may have mild symptoms of compromised renal function, but symptom management is often obtained through dietary modifications and drug therapy. The listed creatinine and BUN levels are within reference ranges.

2. A nurse knows that specific areas in the ureters have a propensity for obstruction. Prompt management of renal calculi is most important when the stone is located where?

- A) In the ureteropelvic junction
- B) In the ureteral segment near the sacroiliac junction
- C) In the ureterovesical junction
- D) In the urethra

Ans: A

### Feedback:

The three narrowed areas of each ureter are the ureteropelvic junction, the ureteral segment near the sacroiliac junction, and the ureterovesical junction. These three areas of the ureters have a propensity for obstruction by renal calculi or stricture. Obstruction of the ureteropelvic junction is most serious because of its close proximity to the kidney and the risk of associated kidney dysfunction. The urethra is not part of the ureter.
