NASA Technical Note ,1972 *Ideal and Real Atmospheric Boundary Layers* Mathias W. Rotach,Albert A. M. Holtslag,2025-01-20 *Ideal and Real Atmospheric Boundary Layers* is based on the notion that classical books of Boundary Layer Meteorology largely focus on ideal surface conditions while the actual real circumstances often address situations that are more complex like over heterogeneous land and in urban and mountain areas *Ideal and Real Atmospheric Boundary Layers* starts by covering the basic physical principles used in atmospheric boundary layer meteorology including atmospheric turbulence observing and modeling atmospheric boundary layers and neutral convective and stable boundary layers over different types of land surfaces The second part of the book describes the applications and extension of these principles for real world circumstances The book will be of interest to researchers and students in atmospheric science climate science and meteorology Covers state of current research into ideal and real boundary layers Includes methods and applications of the principles covered in the book Features highly visual content including infographics to further exemplify principles and applications covered in the text ***Dynamics of the Tropical Atmosphere and Oceans* Peter J. Webster,2020-06-08** This book presents a unique and comprehensive view of the fundamental dynamical and thermodynamic principles underlying the large circulations of the coupled ocean atmosphere system *Dynamics of The Tropical Atmosphere and Oceans* provides a detailed description of macroscale tropical circulation systems such as the monsoon the Hadley and Walker Circulations El Ni o and the tropical ocean warm pool These macroscale circulations interact with a myriad of higher frequency systems ranging from convective cloud systems to migrating equatorial waves that attend the low frequency background flow Towards understanding and predicting these circulation systems A comprehensive overview of the dynamics and thermodynamics of large scale tropical atmosphere and oceans is presented using both a reductionist and holistic perspectives of the coupled tropical system The reductionist perspective provides a detailed description of the individual elements of the ocean and atmospheric circulations The physical nature of each component of the tropical circulation such as the Hadley and Walker circulations the monsoon the incursion of extratropical phenomena into the tropics precipitation distributions equatorial waves and disturbances described in detail The holistic perspective provides a physical description of how the collection of the individual components produces the observed tropical weather and climate How the collective tropical processes determine the tropical circulation and their role in global weather and climate is provided in a series of overlapping theoretical and modelling constructs The structure of the book follows a graduated framework Following a detailed description of tropical phenomenology the reader is introduced to dynamical and thermodynamical constraints that guide the planetary climate and establish a critical role for the tropics Equatorial wave theory is developed for simple and complex background flows including the critical role played by moist processes The manner in which the tropics and the extratropics interact is then described followed by a discussion of the physics behind the subtropical and near equatorial

precipitation including arid regions The El Niño phenomena and the monsoon circulations are discussed including their covariance and predictability Finally the changing structure of the tropics is discussed in terms of the extent of the tropical ocean warm pool and its relationship to the intensity of global convection and climate change Dynamics of the Tropical Atmosphere and Oceans is aimed at advanced undergraduate and early career graduate students It also serves as an excellent general reference book for scientists interested in tropical circulations and their relationship with the broader climate system
