

Key terms

Autosome: Chromosome that is not involved in determining the sex of an individual. Humans have 23 pairs of chromosomes made up of 22 pairs of autosomes and one pair of sex chromosomes.

Crossing over: Exchange of alleles between non-sister chromatids (replicated copies of chromosomes of a homologous pair) during meiosis I.

Sex chromosomes: The pair of chromosomes that determines whether an individual is male (XY) or female (XX). These chromosomes may also contain genes for other characteristics that are therefore sex-linked.

Figure 7.5.4: How crossing over during meiosis produces genetic recombinants.

Essential Genetics Daniel L. Hartl, Elizabeth W. Jones, 2006 Completely updated to reflect new discoveries and current thinking in the field the Fourth Edition of Essential Genetics is designed for the shorter less comprehensive introductory course in genetics The text is written in a clear lively and concise manner and includes many special features that make the book user friendly Topics were carefully chosen to provide a solid foundation for understanding the basic processes of gene transmission mutation expression and regulation The text also helps students develop skills in problem solving achieve a sense of the social and historical context in which genetics has developed and become aware of the genetic resources and information available through the Internet

Introduction to Genetics Terry A. Brown, 2025-02-18 Nowadays genetics focuses on DNA Just like the first edition the theme of this new edition Introduction to Genetics A Molecular Approach is therefore the progression from molecules DNA and genes to processes gene expression and DNA replication to systems cells organisms and populations This progression reflects both the basic logic of life and the way in which modern biological research is structured The molecular approach is particularly suitable for students for whom genetics is part of a broader program in biology biochemistry the biomedical sciences or biotechnology This book presents the basic facts and concepts with enough depth of knowledge to stimulate students to move on to more advanced aspects of the subject This second edition has been thoroughly updated to cover new discoveries and developments in genetics from the last ten years There are new chapters that introduce important techniques such as DNA sequencing and gene editing and the applications of genetics in our modern world are covered in chapters describing topics as diverse as gene therapy and the use of ancient DNA to study prehistoric ecosystems Key Features This book provides a molecular approach to the study of genetics It is a highly accessible and well structured book with chapters organized into four parts to aid navigation It presents high quality illustrations to elucidate the various concepts and mechanisms Each chapter ends with a Key Concepts section which serves to summarize the most essential points Self study questions enable the reader to assess their comprehension of chapter content and discussion topics facilitate a deeper understanding of the material by encouraging conversation and critical evaluation Key terms are emboldened throughout the text and are listed at the end of each chapter and definitions can be found in the Glossary For instructors who adopt the book an affiliated question bank is free to download

Snyder,1988 RECOMB 2003 Webb Miller,2003 We study haplotype reconstruction under the Mendelian law of inheritance and the minimum recombination principle on pedigree data We prove that the problem of finding a minimum recombinant haplotype configuration MRHC is in general NP hard This is the first complexity result concerning the problem to our knowledge An iterative algorithm based on blocks of consecutive resolved marker loci called block extension is proposed It is very efficient and can be used for large pedigrees with a large number of markers especially for those data sets requiring few recombinants or recombination events A polynomial time exact algorithm for haplotype reconstruction without recombinants is also presented This algorithm first identifies all the necessary constraints based on the Mendelian law and the zero recombinant assumption and represents them using a system of linear equations over the cyclic group \mathbb{Z}_2 By using a simple method based on Gaussian elimination we could obtain all possible feasible haplotype configurations We have tested the block extension algorithm on simulated data generated on three pedigree structures The results show that the algorithm performs very well on both multi allelic and biallelic data especially when the number of recombinants is small **Retinal Pharmacotherapy E-Book** Quan Dong Nguyen,Eduardo Buchele Rodrigues,Michel Eid
