Invisible in the Storm Ian Roulstone, John Norbury, 2013-02-21 An accessible book that examines the mathematics of weather prediction *Invisible in the Storm* is the first book to recount the history personalities and ideas behind one of the greatest scientific successes of modern times the use of mathematics in weather prediction Although humans have tried to forecast weather for millennia mathematical principles were used in meteorology only after the turn of the twentieth century From the first proposal for using mathematics to predict weather to the supercomputers that now process meteorological information gathered from satellites and weather stations Ian Roulstone and John Norbury narrate the groundbreaking evolution of modern forecasting The authors begin with Vilhelm Bjerknes a Norwegian physicist and meteorologist who in 1904 came up with a method now known as numerical weather prediction Although his proposed calculations could not be implemented without computers his early attempts along with those of Lewis Fry Richardson marked a turning point in atmospheric science Roulstone and Norbury describe the discovery of chaos theory's butterfly effect in which tiny variations in initial conditions produce large variations in the long term behavior of a system dashing the hopes of perfect predictability for weather patterns They explore how weather forecasters today formulate their ideas through state of the art mathematics taking into account limitations to predictability Millions of variables known unknown and approximate as well as billions of calculations are involved in every forecast producing informative and fascinating modern computer simulations of the Earth system Accessible and timely *Invisible in the Storm* explains the crucial role of mathematics in understanding the ever changing weather Some images inside the book are unavailable due to digital copyright restrictions

People Are you more likely to become a professional footballer if your surname is Ball How can you be one hundred per cent sure you will win a bet Why did so many Pompeians stay put while Mount Vesuvius was erupting How do you prevent a nuclear war Ever since the dawn of human civilisation we have been trying to make predictions about what s in store for us We do this on a personal level so that we can get on with our lives efficiently should I hang my laundry out to dry or will it rain But we also have to predict on a much larger scale often for the good of our broader society how can we spot economic downturns or prevent terrorist attacks For just as long we have been getting it wrong From religious oracles to weather forecasters and from politicians to economists we are subjected to poor predictions all the time Our job is to separate the good from the bad Unfortunately the foibles of our own biology the biases that ultimately make us human can let us down when it comes to making rational inferences about the world around us And that can have disastrous consequences How to Expect the Unexpected will teach you how and why predictions go wrong help you to spot phony forecasts and give you a better chance of getting your own predictions correct

Visual Saliency: From Pixel-Level to Object-Level Analysis Jianming Zhang,Filip Malmberg,Stan Sclaroff,2019-01-21 This book provides an introduction to recent advances in theory algorithms and application of Boolean map distance for image processing Applications include modeling what humans find salient or prominent in an image and then using this for guiding smart image cropping selective image filtering image segmentation image matting etc In this book the authors present methods for both traditional and emerging saliency computation tasks ranging from classical low level tasks like pixel level saliency detection to object level tasks such as subitizing and salient object detection For low level tasks the authors focus on pixel level image processing approaches based on efficient distance transform For object level tasks the authors propose data driven methods using deep convolutional neural networks The book includes both empirical and theoretical studies together with implementation details of the proposed methods Below are the key features for different types of readers For computer vision and image processing practitioners Efficient algorithms based on image distance transforms for two pixel level saliency tasks Promising deep learning techniques for two novel object level saliency tasks Deep neural network model pre training with synthetic data Thorough deep model analysis including useful visualization techniques and generalization tests Fully reproducible with code models and datasets available For researchers interested in the intersection between digital topological theories and computer vision problems Summary of theoretic findings and analysis of Boolean map distance Theoretic algorithmic analysis Applications in salient object detection and eye fixation prediction Students majoring in image processing machine learning and computer vision This book provides up to date supplementary reading material for course topics like connectivity based image processing deep learning for image processing Some easy to implement algorithms for course projects with data provided as links in the book Hands on programming exercises in digital topology and deep learning

Transformations and Projections in Computer Graphics David Salomon,2007-01-21 This book introduces perspective and discusses the mathematics of perspective in a detailed yet

accessible style It also reviews nonlinear projections including the fisheye panorama and map projections frequently used to enhance digital images Topics and features include a complete and self contained presentation of concepts principles and methods a 12 page colour section and numerous figures This essential resource for computer professionals both within and outside the field of Computer Graphics is also suitable for graduates and advanced undergraduates in Computer Graphics and Computer Aided Design Key ideas are introduced examined and illustrated by figures and examples and reinforced through solved exercises

Radon and Projection Transform-Based Computer Vision Jorge L.C. Sanz, Eric B. Hinkle, Anil K. Jain, 2013-03-07 This book deals with novel machine vision architecture ideas that make real time projection based algorithms a reality The design is founded on raster mode processing which is exploited in a powerful and flexible pipeline We concern ourselves with several image analysis algorithms for computing projections of gray level images along linear patterns i e the Radon transform and other curved contours convex hull approximations the Hough transform for line and curve detection diameters moments and principal components etc Additionally we deal with an extensive list of key image processing tasks which involve generating discrete approximations of the inverse Radon transform operator computer tomography reconstructions two dimensional convolutions rotations and translations multi color digital masks the discrete Fourier transform in polar coordinates autocorrelations etc Both the image analysis and image processing algorithms are supported by a similar architecture We will also of some of the above algorithms to the solution of demonstrate the applicability various industrial visual inspection problems The algorithms and architectural ideas surveyed here unleash the power of the Radon and other non linear transformations for machine vision applications We provide fast methods to transform images into projection space representations and to backtrace projection space information into the image domain The novelty of this approach is that the above algorithms are suitable for implementation in a pipeline architecture Specifically random access memory and other dedicated hardware components which are necessary for implementation of classical techniques are not needed for our algorithms

Questions of Uniqueness and Resolution in Reconstruction from Projections M. B. Katz, 2013-03-13 Reconstruction from projections has

revolutionized radiology and has now become one of the most important tools of medical diagnosis The E M I Scanner is one

example In this text some fundamental theoretical and practical questions are resolved Despite recent research activity in the area the crucial subject of the uniqueness of the reconstruction and the effect of noise in the data posed some unsettled fundamental questions In particular Kennan Smith proved that if we describe an object by a C^∞ function i e infinitely differentiable with compact support then there are other objects with the same shape i e support which can differ almost arbitrarily and still have the same projections in finitely many directions On the other hand he proved that objects in finite dimensional function spaces are uniquely determined by a single projection for almost all angles i e except on a set of measure zero Along these lines Herman and Rowland in Three Methods for reconstructing objects from x rays a comparative study 1973 showed that reconstructions obtained from the commonly used algorithms can grossly misrepresent the object and that the algorithm which produced the best reconstruction when using noiseless data gave unsatisfactory results with noisy data Equally important are reports in Science and personal communications by radiologists indicating that in medical practice failure rates of reconstruction vary from four to twenty percent within this work the mathematical dilemma posed by Kennan Smith s result is discussed and clarified
