Hot Pixel Prediction and Novel Intra Prediction Algorithms for H265 and AV1 Encoders Ariel Shleifer, 2018 The demand for streaming video content is on the rise and growing exponentially Networks bandwidth is very costly and therefore there is a constant effort to improve video compression rates and enable the sending of reduced data volumes while retaining quality of experience QoE One basic feature that utilizes the spatial correlation of pixels for video compression is Intra Prediction which determines the codec's compression efficiency Intra prediction enables significant reduction of the Intra Frame I frame key frame size and therefore contributes to efficient exploitation of bandwidth Therefore there is high motivation to improve the Intra Prediction scheme with new original and proprietary algorithms that will enhance the overall performance of future codecs In this work we propose new Intra Prediction algorithms that improve the AV1 prediction model and provide better compression ratios Two types of methods are considered 1 New non angular Intra Prediction modes 2 New scanning order method that maximizes spatial correlation in order to reduce prediction error Using our initial study of the hot pixel problem we've found a concept that can be used for Intra prediction to achieve a better block prediction The initial study was concluded in our first paper 1 A Shleifer and O Hadar Improvements for hot pixels in digital imagers using lossless approximation techniques in SPIE Optics Photonics conference Proc of SPIE Vol 9599 pp 1 7 9 13 August 2015 San Diego California USA 7 In this work instead of using different angles for predictions we introduce several unconventional Intra Prediction modes Weighted CALIC WCALIC Intra Prediction using System of Linear Equations ISLE Prediction of Discrete Cosine Transformations PrDCT Coefficients and Reverse Least Power of Three RLPT etc Employed on a selection of eleven typical images with a variety of spatial characteristics by using Mean Square Error MSE evaluation criteria we show that our proposed algorithms modes were preferred and thus selected around 57% of the blocks resulting in a reduced average prediction error i.e. the MSE of 26% These results were published in

the second paper 2 A Shleifer C Lanka M Setia S Agarwal O Hadar and D Mukherjee Novel Intra Prediction modes for VP10 Codec in SPIE Optics Photonics conference 28th August 1st September 2016 San Diego California USA 12 Using the current VVC code JEM I implemented modes and achieved valuable rate reduction with WCALIC average results bd rate 2 4622 bd psnr 0 1915 and ISLE average results bd rate 5 9154 bd psnr 0 3356 Modern video coding standards including AV1 and HEVC codecs utilize fixed scan orders in processing blocks during intra coding The fixed scan orders typically result in residual blocks with high prediction error mainly in blocks with edges This means that the fixed scan orders cannot fully exploit the content adaptive spatial correlations between adjacent blocks thus the bitrate after compression tends to be large To reduce the bitrate induced by inaccurate intra prediction the proposed approach adaptively chooses the scanning order of blocks according to criteria of firstly predicting blocks with maximum number of surrounding already Inter Predicted blocks Using the modified scanning method and the new modes has reduced the MSE by up to five times when compared to conventional TM mode with a Raster scan and up to two times when compared to conventional CALIC mode with a Raster scan depending on the image characteristics which determines the percentage of blocks predicted with Inter Prediction which in turn impacts the efficiency of the new scanning method These results were published in the paper 3 A Shleifer D Mukherjee U Joshi I Mazar M Yuzvinsky N Tavor N Itzhak R Birman and O Hadar Novel Modes and Adaptive Block Scanning Order for Intra Prediction in AV1 in SPIE Optics Photonics conference 6th 10th August 2017 10 pages San Diego California USA 13 abstract
