Language, Memory, and Cognition in Infancy and Early Childhood Janette B. Benson,Marshall M. Haith,2010-05-22 Language cognition and memory are traditionally studied together prior to a researcher specializing in any one area They are studied together initially because much of the development of one can affect the development of the others Most books available now either tend to be extremely broad in the areas of all infant development including physical and social development or specialize in cognitive development language acquisition or memory Rarely do you find all three together despite the fact that they all relate to each other This volume consists of focused articles from the authoritative Encyclopedia of Infant and Early Childhood Development and specifically targets the ages 0 3 Providing summary overviews of basic and cutting edge research coverage includes attention assessment bilingualism categorization skills critical periods learning disabilities reasoning speech development etc This collection of articles provides an essential affordable reference for researchers graduate students and clinicians interested in cognitive development language development and memory as well as those developmental psychologists interested in all aspects of development Focused content on age 0 3 saves time searching for and wading through lit on full age range for developmentally relevant info Concise understandable and authoritative easier to comprehend for immediate applicability in

research *Language Disorders from Infancy Through Adolescence - E-Book* Rhea Paul, Courtenay Norbury, 2012-01-14

Language Disorders from Infancy Through Adolescence 4th Edition is the go to text for all the information you need to properly assess childhood language disorders and provide appropriate treatment. This core resource spans the entire developmental period through adolescence and uses a descriptive developmental approach to present basic concepts and vocabulary, an overview of key issues and controversies, the scope of communicative difficulties that make up child language disorders, and information on how language pathologists approach the assessment and intervention processes. This new edition also features significant updates in research trends, instruction, best practices, and social skills assessment. Comprehensive text covers the entire developmental period through adolescence. Clinical application focus featuring case studies, clinical vignettes, and suggested projects helps you apply concepts to professional practice. Straightforward conversational writing style makes this book easy to read and understand. More than 230 tables and boxes summarize important information such as dialogue examples, sample assessment plans, assessment and intervention principles, activities, and sample transcripts. UNIQUE Practice exercises with sample transcripts allow you to apply different methods of analysis. UNIQUE Helpful study guides at the end of each chapter help you review and apply what you have learned. Versatile text is perfect for a variety of language disorder courses and serves as a great reference tool for professional practitioners. Highly regarded lead author Rhea Paul lends her expertise in diagnosing and managing pediatric language disorders. Communication development milestones are printed on the inside front cover for quick access. Chapter objectives summarize what you can expect to learn in each chapter. Updated content features the latest research, theories, trends, and techniques in the field. Information on autism incorporated throughout the text. Best practices in preliteracy and literacy instruction. The role of the speech language pathologist on school literacy teams and in response to intervention. New reference sources. Student Professional Resources on Evolve include an image bank, video clips, and references linked to PubMed.

Handy numbers: finger counting and numerical cognition Frank Domahs, Liane Kaufmann, Martin H. Fischer, We are born with a number sense, the ability to respond to numerosity, which we share with other vertebrates. This inherited numerosity representation is approximate and follows the Weber-Fechner law that governs sensory perception. As educated adults, we can also use culturally developed abstract symbol systems to represent exact numerosities in particular number words and Arabic numbers. This developmental stage is preceded by an apparently transient phase of finger counting and finger calculation. In fact, the use of fingers to represent number is ubiquitous across ages and cultures. Children use finger counting even if they are discouraged to do so, sometimes even before they are able to utter the number word sequence. Furthermore, finger counting strategies may also be used by adults diagnosed with dyscalculia to make up for a deficient or absent mental number representation. The advantages of finger counting are evident. Fingers are readily available and perceptually salient. Finger numerical representations support short-term memory and they provide a transparent one-to-one relationship between

to be counted objects and their representation Obviously however these advantages only hold for small numbers Fully transparent finger counting systems are limited to the number range between zero and ten Larger numbers can only be represented in perceptually less salient or symbolic ways In recent years a growing body of evidence has suggested that finger based representations of number do not form an arbitrary and transient stage of cognitive development Rather they seem to provide a good example of embodied cognition According to this influential viewpoint all of our knowledge is represented together with the sensory and motor activity that was present during its acquisition As a consequence even a supposedly abstract cognitive ability such as numerical cognition reuses the neural substrate and inherits functional properties of more basic perceptual and or motor processes Consistent with this assumption finger counting habits and numerical processing do interact even in educated adults casting doubts on purely abstract accounts of mental number representations The objective of this Research Topic is to document embodiment signatures in number processing and calculation a domain of cognition that was long considered to epitomize the abstract symbol manipulation approach to human cognition To this end we invite empirical contributions using different methodologies including behavioural developmental neuroscientific educational cross cultural and neuropsychological studies Moreover we also seek theoretical contributions review articles or opinion papers Questions to be tackled may include but are not restricted to the following Is finger counting only a useful or even a necessary step towards the acquisition of symbolic number representations What are the neural correlates of the finger number relationship Which features of finger counting influence adult number processing both approximate and exact How can finger counting systems be classified typologically and how do different finger counting systems influence numerical cognition across cultures and populations Should finger counting and finger calculation be promoted or discouraged in maths education How are disturbances of finger gnosis and numerical abilities linked We hope that this Research Topic will bring together researchers from different backgrounds to fruitfully discuss a topic which has both scientific and every day relevance
