Directions: Complete 3 questions in any direction (diagonal, straight, rows, columns). Use space below the tic - tac - toe board to solve problems, compare, explain or model. Please see teacher for paper to create a mini poster.]

Solve: $2x + 4 = 12$	Explain: What steps do you need to take to solve $3x + 4 = 8$	Create: Create a mini poster for your fellow students that includes a 2 step equation, the steps to solving it and a model of how it should be solved correctly
Solve: $4 - 3x = 2x + 2$	**FREE SPACE**	Create: Write a story that describes a scenario that could be modeled by the equation $2x + 4 = 12$
Compare: What are the similarities between solving the following equations: A: $15x + 4 = 12$ B: $2x + 7 = 13$	Explain: In which step did the student make an error? Describe the error the correctly solve the problem. $15x + 4 = 12$ Step 1: $x + 4 = 24$ Step 2: $x = 28$	Model: Using a visual representation (i.e. drawing, algebra tiles, etc...), model how you would solve the equation $3x + 2 = 10$

Differentiating Instruction in Algebra 1 Kelli Jurek, 2021-09-03 Teachers often have too little time to prepare differentiated lessons to meet the needs of all students Differentiating Instruction in Algebra 1 provides ready to use resources for Algebra 1 students The book is divided into four units introduction to functions and relationships systems of linear equations exponent rules and exponential functions and quadratic functions Each unit includes big ideas essential questions the Common Core State Standards addressed within that section pretests learning targets varied activities and answer keys The activities offer choices to students or three levels of practice based on student skill level Differentiating Instruction in Algebra 1 is just the resource math teachers need to provide exciting and challenging algebra activities for all students Grades 7-10

Diophantine Approximation Robert F. Tichy, Hans Peter Schlickewei, Klaus Schmidt, 2008-07-10 This volume contains 22 research and survey papers on recent developments in the field of diophantine approximation The first article by Hans Peter Schlickewei is devoted to the scientific work of Wolfgang Schmidt Further contributions deal with the subspace theorem and its applications to diophantine equations and to the study of linear recurring sequences The articles are either in the spirit of more classical diophantine analysis or of geometric or combinatorial flavor In particular estimates for the number of solutions of diophantine equations as well as results concerning congruences and polynomials are established Furthermore the volume contains transcendence results for special functions and contributions to metric diophantine approximation and to discrepancy theory The articles are based on lectures given at a conference at the Erwin Schrödinger Institute in Vienna in 2003 in which many leading experts in the field of diophantine approximation participated The editors are very grateful to the Erwin Schrödinger Institute and to the FWF Austrian Science Fund for the financial support and they express their particular thanks to Springer Verlag for the excellent cooperation Robert E Tichy Diophantine Approximation H E Schlickewei et al Editors 9 Springer Verlag 2008 THE MATHEMATICAL WORK OF WOLFGANG SCHMIDT Hans Peter Schlickewei Mathematik Informatik und Philipps Universität Hans Meerwein Strasse Marburg 35032 Marburg Germany k Introduction Wolfgang Schmidt s mathematical activities started more than fifty years ago in 1955 In the meantime he has written more than 180 papers many of them containing spectacular results and breakthroughs in different areas of number theory

Approximate Dynamic Programming Warren B. Powell, 2007-10-05 A complete and accessible introduction to the real world applications of approximate dynamic programming With the growing levels of sophistication in modern day operations it is vital for practitioners to understand how to approach model and solve complex industrial problems Approximate Dynamic Programming is a result of the author s decades of experience working in large industrial settings to develop practical and high quality solutions to problems that involve making decisions in the presence of uncertainty This groundbreaking book uniquely integrates four distinct disciplines Markov design processes mathematical programming simulation and statistics to demonstrate how to successfully model and solve a wide range of real life problems

using the techniques of approximate dynamic programming ADP The reader is introduced to the three curses of dimensionality that impact complex problems and is also shown how the post decision state variable allows for the use of classical algorithmic strategies from operations research to treat complex stochastic optimization problems Designed as an introduction and assuming no prior training in dynamic programming of any form Approximate Dynamic Programming contains dozens of algorithms that are intended to serve as a starting point in the design of practical solutions for real problems The book provides detailed coverage of implementation challenges including modeling complex sequential decision processes under uncertainty identifying robust policies designing and estimating value function approximations choosing effective stepsize rules and resolving convergence issues With a focus on modeling and algorithms in conjunction with the language of mainstream operations research artificial intelligence and control theory Approximate Dynamic Programming Models complex high dimensional problems in a natural and practical way which draws on years of industrial projects Introduces and emphasizes the power of estimating a value function around the post decision state allowing solution algorithms to be broken down into three fundamental steps classical simulation classical optimization and classical statistics Presents a thorough discussion of recursive estimation including fundamental theory and a number of issues that arise in the development of practical algorithms Offers a variety of methods for approximating dynamic programs that have appeared in previous literature but that have never been presented in the coherent format of a book Motivated by examples from modern day operations research Approximate Dynamic Programming is an accessible introduction to dynamic modeling and is also a valuable guide for the development of high quality solutions to problems that exist in operations research and engineering The clear and precise presentation of the material makes this an appropriate text for advanced undergraduate and beginning graduate courses while also serving as a reference for researchers and practitioners A companion Web site is available for readers which includes additional exercises solutions to exercises and data sets to reinforce the book s main concepts

Reinforcement Learning and Stochastic Optimization Warren B. Powell, 2022-03-15 REINFORCEMENT LEARNING AND STOCHASTIC OPTIMIZATION Clearing the jungle of stochastic optimization Sequential decision problems which consist of decision information decision information are ubiquitous spanning virtually every human activity ranging from business applications health personal and public health and medical decision making energy the sciences all fields of engineering finance and e commerce The diversity of applications attracted the attention of at least 15 distinct fields of research using eight distinct notational systems which produced a vast array of analytical tools A byproduct is that powerful tools developed in one community may be unknown to other communities Reinforcement Learning and Stochastic Optimization offers a single canonical framework that can model any sequential decision problem using five core components state variables decision variables exogenous information variables transition function and objective function This book highlights twelve types of uncertainty that might enter any model and pulls together the diverse set of methods for making

Latest Trends of Information Technology Dr. Kashif Qureshi, 2019-07-20 Just some years before there have been no throngs of Machine Learning scientists developing intelligent merchandise and services at major corporations and startups Once the youngest folks the authors entered the sector machine learning didn't command headlines in daily newspapers Our oldsters had no plan what machine learning was including why we would like it to a career in medication or law Machine learning was an advanced tutorial discipline with a slender set of real world applications And people applications e.g. speech recognition and pc vision needed most domain data that they were usually thought to be separate areas entirely that machine learning was one tiny part Neural networks the antecedents of the deep learning models that we tend to specialize in during this book were thought to be out of date tools In simply the previous five years deep learning has taken the world by surprise using fast progress in fields as diverse as laptop vision herbal language processing computerized speech recognition reinforcement learning and statistical modelling With these advances in hand we can now construct cars that power themselves with increasing autonomy clever reply structures that anticipate mundane replies assisting humans to dig out from mountains of email and software program retailers that dominate the world's first class people at board video games like Go a feat once deemed to be a long time away Already these equipment are exerting a widening impact changing the way films are made diseases are diagnosed and enjoying a

developing role in simple sciences from astrophysics to biology This e book represents our attempt to make deep learning approachable instructing you each the concepts the context and the code *Mathematics of Optimization: How to do Things Faster* Steven J. Miller, 2017-12-20 Optimization Theory is an active area of research with numerous applications many of the books are designed for engineering classes and thus have an emphasis on problems from such fields Covering much of the same material there is less emphasis on coding and detailed applications as the intended audience is more mathematical There are still several important problems discussed especially scheduling problems but there is more emphasis on theory and less on the nuts and bolts of coding A constant theme of the text is the why and the how in the subject Why are we able to do a calculation efficiently How should we look at a problem Extensive effort is made to motivate the mathematics and isolate how one can apply ideas perspectives to a variety of problems As many of the key algorithms in the subject require too much time or detail to analyze in a first course such as the run time of the Simplex Algorithm there are numerous comparisons to simpler algorithms which students have either seen or can quickly learn such as the Euclidean algorithm to motivate the type of results on run time savings **AI 2003: Advances in Artificial Intelligence** Tamas D. Gedeon, Lance C.C. Fung, 2003-12-01 Consider the problem of a robot algorithm learning mechanism moving along the real line attempting to locate a particular point To assist the mechanism we assume that it can communicate with an Environment Oracle which guides it with information regarding the direction in which it should go If the Environment is deterministic the problem is the Deterministic Point Location Problem which has been studied rather thoroughly 1 In its pioneering version 1 the problem was presented in the setting that the Environment could charge the robot a cost which was proportional to the distance it was from the point sought for The question of having multiple communicating robots locate a point on the line has also been studied 1 2 In the stochastic version of this problem we consider the scenario when the learning mechanism attempts to locate a point in an interval with stochastic i e possibly erroneous instead of deterministic responses from the environment Thus when it should really be moving to the right it may be advised to move to the left and vice versa Apart from the problem being of importance in its own right the stochastic point location problem also has potential applications in solving optimization problems In many optimization solutions for example in image processing pattern recognition and neural computing 5 9 11 12 14 16 19 the algorithm works its way from its current solution to the optimal solution based on information that it currently has A crucial question is one of determining the parameter which the optimization algorithm should use **AI 2008: Advances in Artificial Intelligence** Wayne Wobcke, 2008-11-13 This book constitutes the refereed proceedings of the 21th Australasian Joint Conference on Artificial Intelligence AI 2008 held in Auckland New Zealand in December 2008 The 42 revised full papers and 21 revised short papers presented together with 1 invited lecture were carefully reviewed and selected from 143 submissions The papers are organized in topical sections on knowledge representation constraints planning grammar and language processing statistical learning machine learning data mining knowledge discovery soft computing vision and image

processing and AI applications **Least Squares Support Vector Machines** Johan A K Suykens, Tony Van Gestel, Joseph De Brabanter, Bart De Moor, Joos P L Vandewalle, 2002-11-12 This book focuses on Least Squares Support Vector Machines LS SVMs which are reformulations to standard SVMs LS SVMs are closely related to regularization networks and Gaussian processes but additionally emphasize and exploit primal dual interpretations from optimization theory The authors explain the natural links between LS SVM classifiers and kernel Fisher discriminant analysis Bayesian inference of LS SVM models is discussed together with methods for imposing sparseness and employing robust statistics The framework is further extended towards unsupervised learning by considering PCA analysis and its kernel version as a one class modelling problem This leads to new primal dual support vector machine formulations for kernel PCA and kernel CCA analysis Furthermore LS SVM formulations are given for recurrent networks and control In general support vector machines may pose heavy computational challenges for large data sets For this purpose a method of fixed size LS SVM is proposed where the estimation is done in the primal space in relation to a Nyström sampling with active selection of support vectors The methods are illustrated with several examples Catalog of Copyright Entries.
