In clinical laboratories, the analyzers performing chemistry, hematology and immunology assays require large quantities of water to correctly perform their high-throughput operations. Hundreds to thousands of liters of purified water can be used by these clinical analyzers every day, within the assays themselves and to rinse and clean the automates.

Any water issue—whether related to contaminants, quality fluctuations or supply continuity—could cause analyzer downtime, resulting in a loss of laboratory productivity and a delay in delivering results to physicians and their patients. This makes the water purification system one of the most critical instruments in any biomedical laboratory.

This document aims to help clinical lab managers understand the features available within modern water purification systems that can assist in assuring their productivity. Purification technologies, system design features, and service capabilities that can prevent, reduce, and mitigate downtime of the water purification system are described. Innovations that limit water consumption, thereby reducing running costs and supporting greater laboratory efficiency are also discussed.

Concurrency is a fundamental mechanism of the universe existing in all structures and at all levels of granularity To be useful

in this universe any computer system has to model and reflect an appropriate level of abstraction For simplicity therefore the system needs to be concurrent so that this modeling is obvious and correct Today the commercial reality of multicore processors means that concurrency issues can no longer be ducked if applications are going to be able to exploit more than an ever diminishing fraction of their power This is a second but very forceful reason to take this subject seriously We need theory and programming technology that turns this around and makes concurrency an elementary part of the everyday toolkit of every software engineer This is what these proceedings are all about Subjects covered in this volume include system design and implementation for both hardware and software tools for concurrent programming languages libraries and run time kernels and formal methods and applications
