Visual Differential Geometry and Forms Tristan Needham, 2021-07-13 An inviting intuitive and visual exploration of differential geometry and forms Visual Differential Geometry and Forms fulfills two principal goals In the first four acts Tristan Needham puts the geometry back into differential geometry Using 235 hand drawn diagrams Needham deploys Newton's geometrical methods to provide geometrical explanations of the classical results In the fifth act he offers the first undergraduate introduction to differential forms that treats advanced topics in an intuitive and geometrical manner Unique features of the first four acts include four distinct geometrical proofs of the fundamentally important Global Gauss Bonnet theorem providing a stunning link between local geometry and global topology a simple geometrical proof of Gauss's famous Theorema Egregium a complete geometrical treatment of the Riemann curvature tensor of an n manifold and a detailed geometrical treatment of Einstein's field equation describing gravity as curved spacetime General Relativity together with its implications for gravitational waves black holes and cosmology The final act elucidates such topics as the unification of all the integral theorems of vector calculus the elegant reformulation of Maxwell's equations of electromagnetism in terms of 2 forms de Rham cohomology differential geometry via Cartan's method of moving frames and the calculation of the Riemann tensor using curvature 2 forms Six of the seven chapters of Act V can be read completely independently from the rest of the book Requiring only basic calculus and geometry Visual Differential Geometry and Forms provocatively rethinks the way this important area of mathematics should be considered and taught

Lecture Notes on Elementary Topology and Geometry I.M. Singer, J.A. Thorpe, 2015-05-28 At the present time the average undergraduate mathematics major finds mathematics heavily compartmentalized After the calculus he takes a course in analysis and a course in algebra Depending upon his interests or those of his department he takes courses in special topics If he is exposed to topology it is usually straightforward point set topology if he is exposed to geometry it is usually classical differential geometry The exciting revelations that there is some unity in mathematics that fields overlap that techniques of one field have applications in another are denied the undergraduate He must wait until he is well into graduate work to see interconnections presumably because earlier he doesn't know enough These notes are an attempt to break up this compartmentalization at least in topology geometry What the student has learned in algebra and advanced calculus are used to prove some fairly deep results relating geometry topology and group theory De Rham's theorem the Gauss Bonnet theorem for surfaces the functorial relation of fundamental group to covering space and surfaces of constant curvature as homogeneous spaces are the most noteworthy examples In the first two chapters the bare essentials of elementary point set topology are set forth with some hint of the subject's application to functional analysis

Dynamics on Differential One-Forms Troy L. Story, 2002 Dynamics on Differential One Forms proposes a unifying principle for mathematical models of dynamic systems In Thermodynamics on One Forms chapter I the long standing problem of deriving irreversibility in thermodynamics from reversibility in Hamiltonian mechanics is solved

Differential geometric analysis shows thermodynamics and Hamiltonian mechanics are both irreversible on representative extended phase spaces Dynamics on Differential One Forms II generalizes I to Hamiltonian mechanics geometric optics thermodynamics black holes electromagnetic fields and string fields Mathematical models for these systems are revealed as representations of a unifying principle namely description of a dynamic system with a characteristic differential one form on an odd dimensional differentiable manifold leads by analysis with exterior calculus to a set of differential equations and a tangent vector defining system transformations Relationships between models using exterior calculus and conventional calculus imply a technical definition of dynamic equilibrium Global Analysis of Composite Particles III uses differential topology to develop the theory of large vibration rotation interactions for composite particles A global classical Hamiltonian and corresponding quantum Hamiltonian operator are derived then applied to the molecular vibration rotation problem Characteristic Electromagnetic and Yang Mills Gauge IV uses differential geometry to remove some of the arbitrariness in the gauge and shows how gauge functions for electromagnetic and Yang Mills fields follow the same differential equation

Chirikjian, 2009-09-02 This unique two volume set presents the subjects of stochastic processes information theory and Lie groups in a unified setting thereby building bridges between fields that are rarely studied by the same people Unlike the many excellent formal treatments available for each of these subjects individually the emphasis in both of these volumes is on the use of stochastic geometric and group theoretic concepts in the modeling of physical phenomena Stochastic Models Information Theory and Lie Groups will be of interest to advanced undergraduate and graduate students researchers and practitioners working in applied mathematics the physical sciences and engineering Extensive exercises and motivating examples make the work suitable as a textbook for use in courses that emphasize applied stochastic processes or differential geometry **Differential Forms on Wasserstein Space and Infinite-Dimensional Hamiltonian Systems** Wilfrid Gangbo, Hwa Kil Kim, Tommaso Pacini, 2010 Let \mathcal{M} denote the space of probability measures on \mathbb{R}^D endowed with the Wasserstein metric A differential calculus for a certain class of absolutely continuous curves in \mathcal{M} was introduced by Ambrosio Gigli and Savare In this paper the authors develop a calculus for the corresponding class of differential forms on \mathcal{M} In particular they prove an analogue of Green's theorem for 1 forms and show that the corresponding first cohomology group in the sense of de Rham vanishes For $D \geq 2$ the authors then define a symplectic distribution on \mathcal{M} in terms of this calculus thus obtaining a rigorous framework for the notion of Hamiltonian systems as introduced by Ambrosio and Gangbo Throughout the paper the authors emphasize the geometric viewpoint and the role played by certain diffeomorphism groups of \mathbb{R}^D *Handbook of Mathematics for Engineers and Scientists* Andrei D.
