Kimura,2012-12-06 Theory and practice of tolerances are very important for designing and manufacturing engineering artifacts on a rational basis Tolerance specifies a degree of discrepancy between an idealized object and its physical realization Such discrepancy inevitably comes into our product realization processes because of practical cost consideration or our inability to fully control manufacturing processes Major product and production characteristics which are affected by tolerances are product quality and cost For achieving high precision machines tight tolerance specification is necessary but this will normally increase product cost In order to optimally compromise the conflicting requirements of quality and cost it is essential to take into account of the total product life cycle throughout product planning design manufacturing maintenance and recycling For example in order to construct durable products under severe working conditions low sensitivity of product functionality with respect to tolerances is required In future re use of components or parts will become important and tolerance synthesis with respect to this aspect will be an interesting future research topics **The Guide to Railway**
