Business Requirements That Siebel Workflow Can Meet

The benefits of managing a business process are often not realized because the organization does not manage the business process consistently. This situation can occur due to the large number of business processes that exist in the business environment, or because of the dynamic nature of the information that the process monitors.

Managing important events is central to managing a business process. **Workflow management** is the act of managing an event in a way that properly handles the event. For example, a service department uses processes to manage an open service request or to meet a measurable response time. A workflow process can increase the visibility of these business processes in your organization and make sure that your organization handles them correctly.

Siebel Workflow is a customizable business application that allows you to define, manage, and enforce your business processes and establish process automation in Siebel CRM. Siebel Workflow coordinates the process automation technologies that Siebel CRM provides.

A **workflow process** is a graphically sequenced series of automation steps that support a business process. It specifies inputs and outputs for individual steps and for the entire workflow process. A workflow process can be simple, such as entering a product order, or complex, such as managing a call center. A workflow process can perform operations on data, can include conditional logic, and can call a business service, task list, or subprocess.

You can use a workflow process to do the following:

- Escalate an event.
