This blog describes the technical monitoring transactions that must be carried out to support a PI system. The use of the transactions will enable the "silent running" of the PI system as they will highlight any current issues and detect any problems that may occur in the future. It is envisaged that these transactions will be run by second level support through out the working days on all systems in the production stack landscape unless otherwise specified. The document also captures the subsequent actions which should be undertaken should problems occur.

The central monitoring of SAP Exchange Infrastructure (PI) offers the option of executing various monitoring activities. Primarily, we use the Runtime Workbench, the central tool for accessing PI monitoring.

Central PI monitoring offers the following options:

- Message Monitor
- Communication Channel Monitor
- Performance Monitor
- Java Proxy Runtime Monitor
- Cache Monitor
- Engine Status
- IDOC Monitor
- CPA Cache History
- Channel-Independent Logs

### Message Monitor

Display message processing including aggregated and detailed information about status of messages, identify errors in message processing and perform problem isolation. Manage individual messages by, for example, resending individual message versions.

Message Monitor could be accessed in one of the following ways:

- Open a browser and go to `http://host:port:spmon` to access the Process Integration tools. Then choose Monitoring >> Adapter Engine >> Message Monitor.
- Click on the Message Monitor
- In the message monitor, you can access the message overview or search for persisted or archived messages as described below.
