Transpiration and Multiple Use Management of Thinned Emory Oak Coppice D. Catlow Shipek,2004 The effects of thinning Emory oak *Quercus emoryi* coppice on transpiration have been estimated by the heat pulse velocity HPV method Rootstocks of trees harvested for fuelwood were thinned to one two or three dominant stump sprouts or left as unthinned controls Differences in transpiration rates of the thinned coppice were found for each treatment and the control Earlier research has also shown that thinning of Emory oak stump sprouts influences the growth and volume of the residual coppice and its value for wildlife habitats Therefore a decision matrix is presented to help in the management of thinned Emory oak coppice for optimal combinations of water wood and wildlife benefits
