

Roll Cloud

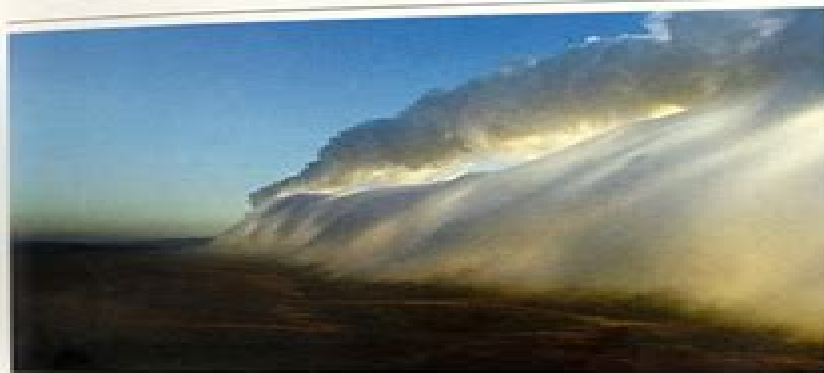

The weathered roll clouds can move ahead of big storms that are brewing.

There is a long, low tube of cloud, which can appear twisted behind from horizon to horizon. Sometimes a roll cloud has two more air surfaces. At other times, it can appear quite rough and lumpy. Roll clouds move at speeds of up to 15 mph, with the tube appearing twisted as it rolls along. The direction of rotation is not as it would be for a storm rolling along the ground. In fact, the roll cloud tends to approach in a spiral—the cloud surface lifting at the front and dropping down to the rear.

One famous roll cloud, "Morning Glory," appears in Northern Queensland, Australia. This forms in a solitary wave of air and is usually solitary, seen between over the Cape York Peninsula. But most roll clouds are associated with storms (see 44), and are caused by storms. As the storm develops, gusts of cold air can continue to spread out ahead of it, and form a roll cloud that separates away from the rest of the storm.

Other Clouds

The queen of roll clouds is Australia's "Morning Glory."
