

## Rock Cycle

### Introduction

Does it seem to you that rocks never change? For example, if you find a chunk of granite today, can you expect that it will still be granite at the end of your lifetime? That may well be true — but only because our lifetimes are very short relative to the history of the earth.

If we take a step back to look at geologic time (which focuses on changes taking place over millions of years), we find that rocks actually do change! All rocks, in fact, change slowly from one type to another, again and again. The changes form a cycle, called "the rock cycle."

The way rocks change depends on various processes that are always taking place on and under the earth's surface.

The concept of the rock cycle is attributed to James Hutton (1726—1797), the 18th-century founder of modern geology. The main idea is that rocks are continually changing from one type to another and back again, as forces inside the earth bring them closer to the surface (where they are weathered, eroded, and compacted) and forces on the earth sink them back down (where they are heated, pressed, and melted). So the elements that make up rocks are never created or destroyed — instead, they are constantly being recycled. The rock cycle helps us to see that the earth is like a giant rock recycling machine!

### Questions:

1. In your own words, explain the rock cycle: Rocks are constantly changing. As forces bring rocks up they are eroded, weathered and, compacted. The forces on earth bring rocks down where they are heated, pressed, and melted.
2. List at least 2 other cycles in nature you have heard of:  
 A. \_\_\_\_\_ The Cycle of life \_\_\_\_\_ B. \_\_\_\_\_ The water cycle \_\_\_\_\_
3. What do all of these cycles have in common?  
 They are always changing.

The rocks on Earth cycle among the following three categories:

Type	Characteristics
 <p>Igneous rocks</p>	<p><b>Igneous</b> rocks are created when molten material such as magma (within the Earth) or lava (on the surface) cools and hardens.</p> <p>When rocks are pushed deep under the Earth's surface, they may melt into magma. If the conditions no longer exist for the magma to stay in its liquid state, it will cool and solidify into different minerals forming an igneous rock.</p> <p>A rock that cools within the Earth is called intrusive or plutonic and will cool very slowly, producing a coarse-grained texture.</p> <p>As a result of volcanic activity, lava may cool very rapidly while being on Earth's surface exposed to the atmosphere and are called extrusive or volcanic rocks. These rocks are fine-grained and sometimes cool so rapidly that no crystals can form and result in a natural glass, such as obsidian.</p> <p>Any of the three main types of rocks (igneous, Sedimentary, and Metamorphic rocks) can melt into magma and cool into igneous rocks.</p>

4. What is the difference between magma and lava? \_\_\_\_\_ Magma can be found within the earth versus lava which is on the surface \_\_\_\_\_
