Signal, 2009 *Developments and Challenges for Autonomous Unmanned Vehicles* Anthony Finn, Steve

Scheding, 2010-03-17 It is widely anticipated that autonomous vehicles will have a transformational impact on military forces and will play a key role in many future force structures As a result many tasks have already been identified that unmanned systems could undertake more readily than humans However for this to occur such systems will need to be agile versatile persistent reliable survivable and lethal This will require many of the vehicles cognitive or higher order functions to be more fully developed whereas to date only the component or physical functions have been successfully automated and deployed The book draws upon a broad range of others work with a view to providing a product that is greater than the sum of its parts The discussion is intentionally approached from the perspective of improving understanding rather than providing solutions or drawing firm conclusions Consequently researchers reading this book with the hope of uncovering some novel theory or approach to automating an unmanned vehicle will be as disappointed as the capability planner who anticipates a catalogue of technical risks and feasibility options against his favoured list of component technologies and potential applications Nevertheless it is hoped that both will at least learn something of the other's world and that progress will ensue as a result For the defence policy and decision maker this is a must read book which brings together an important technology summary with a considered analysis of future doctrinal legal and ethical issues in unmanned and autonomous systems For research engineers and developers of robotics this book provides a unique perspective on the implications and consequences of our craft connecting what we do to the deployment and use of the technology in current and future defence systems
