

# Quantitative Association Rules

- Proposed by Lent, Swami and Widom ICDE'97
- Numeric attributes are *dynamically* discretized
  - Such that the confidence or compactness of the rules mined is maximized
- 2-D quantitative association rules:  $A_{\text{quan1}} \wedge A_{\text{quan2}} \Rightarrow A_{\text{cat}}$
- Cluster *adjacent* association rules to form general rules using a 2-D grid
- Example

$\text{age}(X, "34-35") \wedge \text{income}(X, "30-50K")$   
 $\Rightarrow \text{buys}(X, "high\ resolution\ TV")$

**Development** Gideon Arulmani, Anuradha J. Bakshi, Frederick T. L. Leong, A. G. Watts, 2014-02-08 This book is focused on work occupation and career development themes that are fundamental to a wide range of human activities and relevant across all cultures Yet theorizing and model building about this most ubiquitous of human activities from international perspectives have not been vigorous An examination of the literature pertaining to career development counseling and guidance that has developed over the last fifty years reveals theorizing and model building have been largely dominated by Western epistemologies some of the largest workforces in the world are in the developing world Career guidance is rapidly

emerging as a strongly felt need in these contexts If more relevant models are to be developed frameworks from other cultures and economies must be recognized as providing constructs that would offer a deeper understanding of career development This does not mean that existing ideas are to be discarded Instead an integrative approach that blends universal principles with particular needs could offer a framework for theorizing research and practice that has wider relevance The central objective of this handbook is to draw the wisdom and experiences of different cultures together to consider both universal and specific principles for career guidance and counseling that are socially and economically relevant to contemporary challenges and issues This book is focused on extending existing concepts to broader contexts as well as introducing new concepts relevant to the discipline of career guidance and counseling

*VLSI Design Methodologies for Digital Signal Processing Architectures* Magdy A. Bayoumi, 2012-12-06

Designing VLSI systems represents a challenging task. It is a transformation among different specifications corresponding to different levels of design abstraction: behavioral, structural, and physical. The behavioral level describes the functionality of the design. It consists of two components: static and dynamic. The static component describes operations, whereas the dynamic component describes sequencing and timing. The structural level contains information about components, control, and connectivity. The physical level describes the constraints that should be imposed on the floor plan: the placement of components and the geometry of the design. Constraints of area, speed, and power are also applied at this level. To implement such multilevel transformation, a design methodology should be devised, taking into consideration the constraints, limitations, and properties of each level. The mapping process between any of these domains is non-isomorphic. A single behavioral component may be transformed into more than one structural component. Design methodologies are the most recent evolution in the design automation era, which started off with the introduction and subsequent usage of module generation, especially for regular structures such as PLA's and memories. A design methodology should offer an integrated design system rather than a set of separate, unrelated routines and tools. A general outline of a desired integrated design system is as follows:

- Decide on a certain unified framework for all design levels.
- Derive a design method based on this framework.
- Create a design environment to implement this design method.
