

Quantum Chemistry Exam 1 – Solutions

1.) (16 points) Explain or provide an example illustrating each of the following concepts.

a.) Born probability interpretation

The Born probability interpretation states that the probability of finding a particle in the volume $d\tau = dx\,dy\,dz$ between (x, y, z) and $(x + dx, y + dy, z + dz)$ is given by $\psi^*(x, y, z) \psi(x, y, z) d\tau$.

b.) Normalization

Normalization refers to the scaling of a wavefunction so that the total probability "sums" to 1. Since the wavefunction is expressed in terms of continuous variables, the sum becomes an integral, and the normalization requirement is

$$\int \psi^* \psi d\tau = 1.$$

and the integral is over all space.

c.) Orthogonal functions

Two functions f and g are said to be orthogonal if the integral of their product (with one function as the complex conjugate) equals 0.

$$\int f^* g d\tau = 0.$$

d.) Tunneling

Tunneling is the penetration of the wavefunction into a classically forbidden region (i.e., a region in which $E < V$).

Computational Chemistry Jerzy Leszczynski,2000 This volume comprises six chapters which explore the development and applications of the methods of computational chemistry The first chapter is on new developments in coupled cluster CC theory The homotopy method is used to obtain complete sets of solutions of nonlinear CC equations The correspondence between multiple solutions to the CCSD CCSDT and full CI equations is established and the applications of the new approach in modeling molecular systems are discussed The second chapter reviews the computational theory for the time dependent calculations of a solution to the Schrodinger equation for two electrons and focuses on the development of propagators to the solution The next chapter features a discussion on a new self consistent field for molecular interactions SCF MI scheme for modifying Roothaan equations in order to avoid basis set superposition errors BSSE This method is especially suitable for computations of intermolecular interactions Details of the theory alongwith examples of applications to nucleic acid base pair complexes are given This chapter is well complemented by the following chapter which reports the current status of computational studies of aromatic stacking and hydrogen bonding interactions among nucleic acid bases The next chapter reveals the possibility of calculating the kinetics of chemical reactions in biological systems from the first principles The last chapter reviews the results of rigorous ab initio studies of the series of derivatives of methane silane and germane The presented molecular and vibrational parameters complement experimental data for these systems In addition the theoretical approach allows the prediction of the effects of halogeno substitutions on their structures and properties **TGT Science**
