Anna Abraham,2015-11-23 The pervasive idea that madness and creativity are intricately linked is one that holds tremendous fascination for both scientists and the general public alike Although this view was at first largely driven by anecdotal evidence showcasing the manifestation of mental illness in individuals who exhibited extraordinary levels of creativity in various spheres of life it initiated a strong impetus to empirically investigate the association between mental health and creativity A variety of approaches and combinations of approaches have been adopted to address this association including clinical personality psychometric behavioral cognitive historiometric and neuroscientific Despite the ever accumulating body of evidence over the past six decades investigating this link what is lacking is a comprehensive overview of the disparate findings from these different approaches that will enable us to address the question of whether there is an empirically founded relationship between creativity and mental illness And if such a link does exist what is the nature of this association The purpose of this Research Topic was to motivate theorists and researchers to answer this question or at least attempt to do so given the available evidence thus far The themes of interest that were open to exploration in view of this topic included a Which mental disorders are positively associated with creativity b Which mental disorders are negatively associated with creativity c The dynamics of information processing biases positive versus negative

associated with psychiatric and high risk populations d Theories regarding the madness creativity link e Personality based studies on creativity f Creativity mental illness and the brain g Genes and creativity h How can studies on neurological populations inform this debate i What are the areas of impact with regard to real world applications and practice j Historical timeline of this question k Evolutionary perspectives on the madness creativity link l Methodological problems associated with this field m Philosophical issues to bear in mind when investigating this domain n The usefulness of the troubled genius concept The invitation to contribute was open to all interested academics regardless of whether they were seasoned explorers within this field of study or just beginning to get their feet wet in its murky waters As a result of adopting this inclusive approach the contributions showcase a wide variety of perspectives from academic departments and institutions the world over What is most encouraging is that so many were willing to openly take on the challenge of tackling this difficult question head on We hope future discussions that follow through as a result of this collective effort will prove to be just as fruitful

Motivation, Emotion, and Cognition David Yun Dai, Robert J. Sternberg, 2004-07-13 The central argument of this book is that cognition is not the whole story in understanding intellectual functioning and development To account for inter individual intra individual and developmental variability in actual intellectual performance it is necessary to treat cognition emotion and motivation as inextricably related *Motivation Emotion and Cognition Integrative Perspectives on Intellectual Functioning and Development* represents a new direction in theory and research on intellectual functioning and development portrays human intelligence as fundamentally constrained by biology and adaptive needs but modulated by social and cultural forces and encompasses and integrates a broad range of scientific findings and advances from cognitive and affective neurosciences to cultural psychology addressing fundamental issues of individual differences developmental variability and cross cultural differences with respect to intellectual functioning and development By presenting current knowledge regarding integrated understanding of intellectual functioning and development this volume promotes exchanges among researchers concerned with provoking new ideas for research and provides educators and other practitioners with a framework that will enrich understanding and guide practice

How Do Emotions and Feelings Regulate Physical Activity? Darko Jekauc, Ralf Brand, 2017-09-12 Up to date the scientific discussion about how frequency and regularity of physical activity can be increased is dominated by social cognitive models However increasing evidence suggests that emotions and feelings have greater influence on physical activity than originally assumed Rhodes Fiala Conner 2009 Generally speaking humans possess an evaluative system with a basic action tendency to approach pleasurable events and to avoid aversive ones Cacioppo Berntson 1999 Evaluative responses to a behavior and associated emotional states may influence a decision regarding whether or not to repeat being physically active Generally behavior associated with positive evaluations has a higher probability of being repeated than behaviors without such an association On the contrary an association with negative evaluations tends to decrease the probability of repeating to be physically active Hence evaluative responses to physical activity or the related situation can be an important aspect in the process of physical activity maintenance McAuley et al 2007 Several social cognitive models of behavior change and maintenance were recently extended to take the influence of affective responses into account in a way that variables already included in the models e g outcome expectancies or attitudes were more clearly articulated into their cognitive and affective components For example with regard to Social Cognitive Theory Gellert Ziegelmann and Schwarzer 2012 proposed to distinguish between affective and health related outcome expectancies and in the Theory of Planned Behavior researchers suggested to differentiate between cognitive and affective attitudes Lawton Conner McEachan 2009 The results of these and other studies suggest that affective components make a unique contribution to the explanation of the physical activity behavior Brand 2006 Other examples come from social cognition research where it was shown that automatic evaluative responses are part of our everyday life and that they decisively influence health behavior Hofmann Friese Wiers 2008 Accordingly there is evidence that people who exercise regularly hold more positive automatic evaluations with exercise than non exercisers Bluemke Brand Schweizer Kahlert 2010 Although significant progress has been made in showing that evaluative responses to physical activity and associated emotional states are important predictors of physical activity underlying psychological processes are far from being fully understood Some important issues still remain to be resolved Which role play affective states compared to concrete emotions when influencing physical activity How do affective states and emotions interact with cognitive variables such as intentions Are evaluative processes before during or after physical activity important to predict future physical activity Do negative and positive evaluations interact antagonistically or rather synergistically when physical activity as a new behavior shall be adopted Future research will help us to resolve these and a lot of other so far unresolved issues
