before its processing begins In this lecture we give an overview of recent research in stream processing ranging from
answering simple queries on high speed streams to loading real time data feeds into a streaming warehouse for off line
analysis We will discuss two types of systems for end to end stream processing Data Stream Management Systems DSMSs
and Streaming Data Warehouses SDWs A traditional database management system typically processes a stream of ad hoc
queries over relatively static data In contrast a DSMS evaluates static long running queries on streaming data making a
single pass over the data and using limited working memory In the first part of this lecture we will discuss research problems
in DSMSs such as continuous query languages non blocking query operators that continually react to new data and
continuous query optimization The second part covers SDWs which combine the real time response of a DSMS by loading
new data as soon as they arrive with a data warehouse s ability to manage Terabytes of historical data on secondary storage
