Plant Responses to Biotic and Abiotic Stresses: Lessons from Cell Signaling Sylvain Jeandroz, Olivier Lamotte, 2017-12-28 Facing stressful conditions imposed by their environment and affecting their growth and their development throughout their life cycle plants must be able to perceive to process and to translate different stimuli into adaptive responses Understanding the organism coordinated responses involves a fine description of the mechanisms occurring at the cellular and molecular level A major challenge is also to understand how the large diversity of molecules identified as signals sensors or effectors could drive a cell to the appropriate plant response and to finally cope with various environmental cues In this Research Topic we aim to provide an overview of various signaling mechanisms or to present new molecular signals involved in stress response and to demonstrate how basic fundamental research on cell signaling will help to understand stress responses at the whole plant level

Plant Responses to Environmental Stresses Based on Physiological and Functional Ecology Kaixiong Xing, Chen Chen, Hongbo Li, Deliang Kong, 2023-10-31 Plants require a proper balance of matter and energy to maintain their survival and reproduction Biotic and or abiotic stresses in diverse environments could influence plant photosynthesis water and nutrient acquisition and utilization Through the lens of plant physiological and functional ecology the study of responses of individual plant traits and or integration of plant responses to environmental change has been well developed The variation

of plant physiological characteristics and functional traits has been recognized with hundreds of high quality papers on topics of plant responses to environmental stresses. For now, despite the increasing number of studies trying to establish a linkage between plant physiological processes and functional traits, these covariations have received limited theoretical and experimental verification. This knowledge gap hampers our ability to understand and predict the comprehensive responses of plants to environmental stresses at different scales. Ethylene: A Key Regulatory Molecule in Plants Nafees A. Khan, M. Iqbal R. Khan, Antonio Ferrante, Péter

Poór, 2017-12-21 Ethylene is a simple gaseous phytohormone with multiple roles in regulation of metabolism at cellular, molecular, and whole plant level. It influences performance of plants under optimal and stressful environments by interacting with other signaling molecules. Understanding the ethylene biosynthesis and action through the plant's life can contribute to improve the knowledge of plant functionality and use of this plant hormone may drive adaptation and defense of plants from the adverse environmental conditions. The action of ethylene depends on its concentration in cell and the sensitivity of plants to the hormone. In recent years, research on ethylene has been focused due to its dual action on the regulation of plant processes at physiological and molecular level. The involvement of ethylene in the regulation of transcription needs to be widely explored involving the interaction with other key molecular regulators. The aim of the current research topic was to explore and update our understanding on its regulatory role in plant developmental mechanisms at cellular or whole plant level under optimal and changing environmental conditions. The present edited volume includes original research papers and review articles describing ethylene's regulatory role in plant development during plant ontogeny and also explains how it interacts with biotic and abiotic stress factors. This comprehensive collection of researches provides evidence that ethylene is essential in different physiological processes and does not always work alone but in a coordinated manner with other plant hormones. This research topic is also a source of tips for further works that should be addressed for the biology and molecular effects on plants. **Plants' Responses to Novel Environmental Pressures** Alessio Fini, Massimiliano

Tattini, Raquel Esteban, 2018-02-01 Plants have been exposed to multiple environmental stressors on long-term seasonal and short-term daily basis since their appearance on land. However, the frequency and the intensity of stress events have increased much during the last three decades because of climate change. Plants have developed, however, a multiplicity of modular and highly integrated strategies to cope with challenges imposed by novel, usually harsher environments. These strategies include migration, acclimation, and adaptation. Twelve articles in this research topic exactly focus on the relative

significance of these response mechanisms for the successful acclimation of plants to a wide range of novel environmental pressures Four articles additionally explore how plants respond to severe stress conditions resulting from the concurrent action of multiple stressors Ten articles mostly examine how morpho anatomical physiological and biochemical related traits integrate when plants suffer from novel threats such as solid gaseous and electromagnetic pollutants Suitable physiological indicators for developing conservation strategies are described in the last two works This research topic highlights that bottom up as well as top down approaches will be necessary to develop in near future in the study of plants responses to environmental pressures

Induced plant responses to microbes and insects Corné M. J. Pieterse, Marcel Dicke, Saskia C. M. Van Wees, Erik H. Poelman, 2014-04-14 Plants are members of complex communities and interact both with antagonists and beneficial organisms An important question in plant defense signaling research is how plants integrate signals induced by pathogens insect herbivores and beneficial microbes into the most appropriate adaptive response Molecular and genomic tools are now being used to uncover the complexity of the induced defense signaling networks that have evolved during the arms races between plants and the other organisms with which they intimately interact To understand the functioning of the complex defense signaling network in nature molecular biologists and ecologists have joined forces to place molecular mechanisms of induced plant defenses in an ecological perspective In this Research Topic we aim to provide an on line open access snapshot of the current state of the art of the field of induced plant responses to microbes and insects with a special focus on the translation of molecular mechanisms to ecology and vice versa

Understanding the Molecular Mechanisms of Plant Responses to Abiotic Stress Sang Yeol Lee, Dae-Jin Yun, Jose M. Pardo, Motoaki Seki, Yan Guo, Abel Rosado, 2020-02-20 Plant responses to environmental stress are governed by complex molecular and biochemical signal transduction processes which act in coordination to determine tolerance or sensitivity at the whole plant level Upon exposure to abiotic stress plants express a sophisticated coordinated response to reprogram interconnected defense networks and metabolic pathways by alterations in the transcription translation and post translational modification of defense related genes and proteins Traditionally physiological and phenotypic responses were the major ones to be collected in plant stress biology However modern studies include the identification of key genes that influence stress tolerance and plant growth under the imposing stress and the verification of gene functions using knock out mutants or overexpression lines In addition genomics has become a necessary tool for the understanding of plant stress responses at the whole genome levels The identification of stress tolerant plant resources and the investigation of the functional role of the genetic variants is also a valuable tool in this research field Recently the advent of CRISPR Cas genome editing technology enables these variations to be introduced in crops for improved stress tolerance traits Through the understanding of the molecular mechanisms involved in plant signaling in response to abiotic stress and crop performance characters under stress conditions we hope to open new ways for the breeding of superior crops
