Lesson Objectives

- Explain the role of light and pigments in photosynthesis.
- Explain the role of electron carrier molecules in photosynthesis.
- State the overall equation for photosynthesis.

Lesson Summary

Chlorophyll and Chloroplasts In _____, photosynthesis occurs in organelles called _____. Chloroplasts house _____.

- ▶ Light is a form of energy. Sunlight is a mixture of all the different colors of _____.
- ▶ Light-absorbing molecules called _____ capture the sun's energy.
- ▶ _____ is the principal pigment in photosynthetic organisms. Chlorophyll absorbs _____ and _____ but reflects _____ light.
- ▶ Chloroplasts have a complex internal structure that includes:
 - _____: saclike photosynthetic membranes that contain chlorophyll and other pigments and are arranged in stacks called grana.
 - _____: the fluid portion outside of the thylakoids.

High-Energy Electrons The energy in light raises some of the _____ in chlorophyll to higher energy levels. These high-energy _____ are used in photosynthesis.

- ▶ Electron carriers are used to transport the electrons from chlorophyll to other molecules during photosynthesis.
- ▶ _____ is a compound that can accept and hold 2 high-energy electrons and 1 hydrogen ion. This process converts NADP^+ into NADPH.

An Overview of Photosynthesis Usually summarized by a simple chemical reaction, photosynthesis is a complex process that involves two interdependent sets of reactions.

- ▶ The _____ require light, light-absorbing pigments, and water to form NADPH, ATP, and oxygen.

Goudriaan, H.H. Van Laar, 2012-12-06 We dedicate this book to professor C T de Wit 1924 1993 who initiated Production Ecology as a school of thought at the Wageningen Agricultural University see Rabbinge et al 1990 To acknowledge the leading role of C T de Wit a recently formed graduate school at this university in Production Ecology was named after him Production Ecology is the study of ecological processes with special attention to flows of energy and matter as factors that determine the productivity of ecological systems Agro ecosystems are a special case of ecosystems which are much better suited for the productivity approach than natural ecosystems are This is the reason for the strong role of agricultural research in production ecology On

the other hand it must be recognized that the spatial heterogeneity of natural ecosystems and their species richness may alter some ecophysiological relationships. However, the basic physical, chemical and physiological processes will be the same. De Wit introduced the state variable approach as the basis for simulation modelling. In this approach, the floating character of nature is schematized into a series of snapshots over time in which the states are frozen at each separate moment. The current state determines how the rates of change will lead to the next snapshot. This way of thinking enables a clear and workable representation of interacting simultaneous processes without compromising on the mathematics. **Complete**

Inorganic Chemistry Gary L. Miessler, Donald Arthur Tarr, 2004 For one two semester junior senior level courses in Inorganic Chemistry This highly readable text provides the essentials of Inorganic Chemistry at a level that is neither too high for novice students nor too low for advanced students It has been praised for its coverage of theoretical inorganic chemistry It discusses molecular symmetry earlier than other texts and builds on this foundation in later chapters Plenty of supporting book references encourage instructors and students to further explore topics of interest **Physiological Plant Ecology IV** O. L. Lange, P. S. Nobel, C. B. Osmond, H. Ziegler, 2012-12-06 O L LANGE P S NOBEL C B OSMOND and H ZIEGLER In the last volume of the series Physiological Plant Ecology we have asked contributors to address the bases of ecosystem processes in terms of key plant physiological properties It has often been suggested that it is not profitable to attempt analysis of complex living systems in terms of the properties of component individuals or populations i e the whole is more than the sum of its parts Nevertheless assessments of ecological research over the last century show that other

approaches are seldom more helpful Although it is possible to describe complex systems of living organisms in holistic terms the most useful descriptions are found in terms of the birth growth and death of individuals This allows analysis of performance of the parts of the whole considering their synergistic and antagonistic interrelationships and is the basis for a synthesis which elucidates the specific properties of a system Thus it seems that the description of ecosystem processes is inevitably anchored in physiological understanding If enquiry into complex living systems is to remain a scientific exercise it must retain tangible links with physiology Of course as was emphasized in Vol 12A not all of our physiological understanding is required to explore ecosystem processes For pragmatic purposes the whole may be adequately represented as a good deal less than the sum of its parts

Photosynthesis in the Marine Environment Sven Beer, Mats Björk, John Beardall, 2014-05-27 Marine photosynthesis provides for at least half of the primary production worldwide Photosynthesis in the Marine Environment constitutes a comprehensive explanation of photosynthetic processes as related to the special environment in which marine plants live The first part of the book introduces the different photosynthesising organisms of the various marine habitats the phytoplankton both cyanobacteria and eukaryotes in open waters and macroalgae marine angiosperms and photosymbiont containing invertebrates in those benthic environments where there is enough light for photosynthesis to support growth and describes how these organisms evolved The special properties of seawater for sustaining primary production are then considered and the two main differences between terrestrial and marine environments in supporting photosynthesis and plant growth are examined namely irradiance and inorganic carbon The second part of the book outlines the general mechanisms of photosynthesis and then points towards the differences in light capturing and carbon acquisition between terrestrial and marine plants This is followed by discussing the need for a CO₂ concentrating mechanism in most of the latter and a description of how such mechanisms function in different marine plants Part three deals with the various ways in which photosynthesis can be measured for marine plants with an emphasis on novel in situ measurements including discussions of the extent to which such measurements can serve as a proxy for plant growth and productivity The final chapters of the book are devoted to ecological aspects of marine plant photosynthesis and growth including predictions for the future
