Advances in Cardiovascular Engineering Ned H.C. Hwang, Vincent T. Turitto, Michael R.T. Yen, 2013-11-09 Advances of cardiovascular engineering prompt one to consider innovative device technology that is the development of new replacement heart valves or engineering of a totally implantable energy source for an artificial heart However these kinds of advances have often proved unable to achieve a long lasting benefit as the cardiovascular field has matured so fast Cardiovascular engineering has matured to the point where a major innovation must not only function but must continuously function better than existing devices This is difficult to accomplish in the complex cardiovascular system in which energy source biocompatibility

compliance and functionality all must be considered The maturation of the field is evident from the fact that many engineered prosthetic systems perform well for example heart valves function for long periods of time large vessel vascular grafts are quite adequate extracorporeal membrane oxygenation has significantly prolonged the feasible length of heart bypass and other surgical operations and total artificial hearts can be used as a bridge to transplant without serious complications yet none of these systems is as good as the natural ones it replaces The reasons for this are many and incompletely understood The next stage of progress must be better to alterations understandings of the various components of vasculature and their response by our devices be they at the micro or macro circulatory levels in the blood or associated with the vascular wall

LIFE - AS A MATTER OF FAT Ole G. Mouritsen, Luis A. Bagatolli, 2015-10-08 The present book gives a multi disciplinary perspective on the physics of life and the particular role played by lipids fats and the lipid bilayer component of cell membranes The emphasis is on the physical properties of lipid membranes seen as soft and molecularly structured interfaces By combining and synthesizing insights obtained from a variety of recent studies an attempt is made to clarify what membrane structure is and how it can be quantitatively described Furthermore it is shown how biological function mediated by membranes is controlled by lipid membrane structure and organization on length scales ranging from the size of the individual molecule across molecular assemblies of proteins and lipid domains in the range of nanometers to the size of whole cells Applications of lipids in nanotechnology and biomedicine are also described The first edition of the present book was published in 2005 when lipidomics was still very much an emerging science and lipids about to be recognized as being as important for life as proteins sugars and genes This significantly expanded and revised edition takes into account the tremendous amount of knowledge gained over the past decade In addition the book now includes more tutorial material on the biochemistry of lipids and the principles of lipid self assembly The book is aimed at undergraduate students and young research workers within physics chemistry biochemistry molecular biology nutrition as well as pharmaceutical and biomedical sciences From the reviews of the first edition This is a highly interesting book and a pleasure to read It represents a new and excellent pedagogical introduction to the field of lipids and the biophysics of biological membranes I reckon that physicists and chemists as well as biologists will benefit from this approach to the field and Mouritsen shows a deep insight
