Connect Each of us enters this world as a screaming infant. At first, the ability to eat solid foods or take a step draws forth great praise. These general skills rapidly lose their wonder, however, and by the time you reach the age of 18, everyone wants to know what you plan to do with yourself. Will you build houses or design clothing or treat patients? What will your specialty be? Cells, too, undergo specialization to carry out the complex functions required by the body.

MAIN IDEA

Multicellular organisms depend on interactions among different cell types.

Within multicellular organisms, cells communicate and work together in groups that form increasingly larger, more complex structures. This arrangement progresses from cells to tissues to organs to organ systems, as shown in **FIGURE 5.16**. **Tissues** are groups of cells that work together to perform a similar function. Groups of tissues that work together to perform a specific function or related functions are called **organs**. For instance, plants have photosynthetic tissues made of chlorophyll-containing cells. Conductive tissues transport sugars, water, and minerals to and from other parts of the plant. Protective tissues help prevent water loss. Together, these and other tissues form a leaf, the plant's food-producing organ.

Organs that carry out similar functions are further grouped into **organ systems**. In plants, the shoot system is above the ground. It includes stems that support the plant, leaves that capture radiant energy, and flowers that aid reproduction. Beneath the ground, the root system has different types of roots and root hairs that anchor the plant and absorb water and minerals.

As organ systems work together, they help an organism maintain homeostasis. For example, plants need to maintain a certain level of water within their cells, or they will wilt and die. They absorb water through their roots and expel it as water vapor through openings in their leaves called stomata. Stomata are controlled by special cells called guard cells, which close the stomata when a plant's water intake cannot keep up with its water loss.

Apply Suppose your family goes out of town and forgets to ask your neighbor to water the plants. Do you think the plants' stomata will be open or closed? Explain.

Connecting CONCEPTS

Homeostasis As you learned in Chapter 1, homeostasis is the maintenance of a stable internal environment. Both an organism's physiology and its behavior help it achieve homeostasis.

The Evolution Delusion Bart Rask,2021-09-01 Does the field of evolution differ from other sciences The author a reviewer for a major medical journal scrutinized hundreds of scientific references in evolutionary literature adopting the same standards used for studies submitted for medical publication The data show that there are two types of evolution

microevolution and macroevolution with a clear boundary between them based upon the presence and absence of empirical evidence respectively The surprising results show that there is a universal disconnect between the data and the conclusions that claim to show the larger changes of macroevolution The author reveals patterns of deviations from standard scientific methods in these studies For the first time evolutionary data have been summarized to describe both what evolution can and cannot accomplish The author shows the reader how to recognize the different ways in which the evidence for microevolution within and between some species differs from the unsupported macroevolution of most species Previous critiques of macroevolution have been debunked by advocates who have cited a multitude of scientific studies This book goes beyond previous critiques by directly addressing the data from these studies to see if they do in fact support macroevolution focused conclusions Many expert counterarguments against this book s thesis are presented and examined in the context of scientific research to reassure the reader that the author has left no stone unturned in the macroevolution debate A theory is proposed as to why there may be no empirical evidence for macroevolution The book concludes with a section entitled What we see differently There the author shows the reader the differences in perspective between the evolutionist and macroevolution critic as they look at and interpret the very same set of data Cells: From Cells to Organisms Angela Wagner,2013-04-01
