Signal and Image Processing for Remote Sensing BOGDAN. KARYAVIN, 2015 Signal processing is an enabling technology that encompasses the fundamental theory applications algorithms and implementations of processing or transferring information contained in many different physical symbolic or abstract formats broadly designated as signals Remote sensing can be defined as any process whereby information is gathered about an object area or phenomenon without being in contact with it Image processing is any form of signal processing for which the input is an image Many image processing and analysis techniques have been developed to aid the interpretation of remote sensing images and to extract as much information as possible from the images The book *Signal and Image Processing for Remote Sensing* contains eight chapters First chapter proposes a new method to overcome these

limitations by using 1D signal analysis methods The power quality data compression for remote sensing has been described in the second chapter Third chapter introduces the basic mixed integer programming model that arises from the detailed interaction of technologies A brief description of the InSAR technique as well as an example of processing chain to generate InSAR DEMs have been introduced in the fourth chapter Fifth chapter focuses on the evaluation of the performances of different antenna sensors suitable for Partial Discharge PD measurements Optimized signal separation for 3D polarized light imaging has been focused in sixth chapter The overall process to code a digital hologram video and the whole architecture of the service system for digital holograms are explained in the seventh chapter We discuss various aspects of homomorphic encryption schemes their definitions requirements applications formal construction and the limitations of the current homomorphic encryption schemes in the last chapter
