

# Signal Transduction Pathways

What happens inside of a cell when a signal has been received?

Directions: Remember to answer the following questions using a *different color font*.

## Why?

When cells release signal molecules (ligands) to send a message, and the message is received, a whole host of events take place inside the cell. The ultimate goal is a response—a gene is turned on, a protein is manufactured, an enzyme is activated, the cell divides or dies, etc. There are many responses that could occur, but the pathways to those responses are very similar.

## Model 1 - Basic Signal Transduction Pathway

1. According to Model 1, does the signal transduction pathway occur inside or outside of a cell?

Inside

2. Compare the shape of the ligand in Model 1 to the shape of the receptor protein. What do you observe?

They fit together perfectly

3. The four steps in the signal transduction pathway are listed below. Using the boxes provided, label the diagram above with the Roman numerals to indicate where on the diagram each step is taking place.

- I. Signaling 1-ligand
- II. Reception 2-receptor protein
- III. Transduction 3-activated relay protein 1
- IV. Response 4-response

**Signal Transduction in Plant Growth and Development** Desh P.S. Verma, 2012-12-06 Plant growth and development is controlled by various environmental cues that are sensed by the plant via various signal transduction pathways coupled to specific response Some of these pathways are conserved from yeast to plants being regulated by various kinases and phosphatases In addition plants have many unique pathways that transduce to specific signals such as light phytohormones and oligosaccharides This volume highlights some of the examples of the plant signal transduction machinery opening new vistas in research on plant growth and development The new technologies including the use of bacteria yeast and Arabidopsis as functional complementation systems are providing proof of function of many of the proteins that show homology to those from other organisms These studies will eventually lead to improvement of crop plants and use of plants as a new resource for producing desirable products to meet the growing needs of mankind

*Mechanisms of Angiogenesis* Matthias Clauss, Georg Breier, 2004-11-22 Is it advisable to go back from bedside to the bench During the last decade few topics encountered such a broad interest in biology and medicine as angiogenesis The amazing ability of the body to restore blood flow by induction of blood vessel growth as part of an adaptive process has alarmed physicians dealing with diseases in which angiogenesis is either exaggerated as in tumors or too slow as in ischemic diseases of heart and brain Not surprisingly pro and antiangiogenic strategies have found their way into clinical trials For instance for the USA the NIH website in early 2004 displayed 38 clinical studies involving either pro or antiangiogenic therapies Given the expected overwhelming wealth of clinical data the question may be asked whether further exploration of biological mechanisms is required or whether results from the bedside are instructive enough to proceed This question depends also on the progress of pro and antiangiogenic clinical trials In the following I give a short overview about some of the progress that has been made in this field Since Judah Folkman proposed antiangiogenic tumor therapy thirty years ago it has become increasingly evident that agents which interfere with blood vessel formation also block tumor progression Accordingly antiangiogenic therapy has gained much attention as a potential adjunct to conventional cancer therapy
