witnessing highly dynamic research activities related to the intriguing field of biodegradable materials with plastic like
properties These activities are stimulated by the strengthened public awareness of prevailing ecological issues connected to
growing piles of plastic waste and increasing greenhouse gas emissions this goes hand in hand with the ongoing depletion of
fossil feedstocks which are traditionally used to produce full carbon backbone polymers Polyhydroxyalkanoate PHA
biopolyesters a family of plastic like materials with versatile material properties are increasing considered to be a future
oriented solution for diminishing these concerns PHA production is based on renewable resources and occurs in a bio
mediated fashion through the action of living organisms If accomplished in an optimized way PHA production and the entire
PHA lifecycle are embedded into nature s closed cycles of carbon Sustainable and efficient PHA production requires
understanding and improvement of all the individual process steps Holistic improvement of PHA production applicable on an
industrially relevant scale calls for inter alia consolidated knowledge about the enzymatic and genetic particularities of PHA
accumulating organisms an in depth understanding of the kinetics of the bioprocess the selection of appropriate inexpensive
fermentation feedstocks tailoring of PHA composition at the level of its monomeric constituents optimized biotechnological
engineering and novel strategies for PHA recovery from biomass characterized by low energy and chemical requirements
