Analytic Research Foundations for the Next-Generation Electric Grid National Academies of Sciences, Engineering, and Medicine, Division on Engineering and Physical Sciences, Board on Mathematical Sciences and Their Applications, Committee on Analytical Research Foundations for the Next-Generation Electric Grid, 2016-05-15 Electricity is the lifeblood of modern society and for the vast majority of people that electricity is obtained from large interconnected power grids However the grid that was developed in the 20th century and the incremental improvements made since then including its underlying analytic foundations is no longer adequate to completely meet the needs of the 21st century The next generation electric grid must be more flexible and resilient While fossil fuels will have their place for decades to come the grid of the future will need to accommodate a wider mix of more intermittent generating sources such as wind and distributed solar photovoltaics Achieving this grid of the future will require effort on several fronts There is a need for continued shorter term engineering research and development building on the existing analytic foundations for the grid But there is also a need for more fundamental research to expand these analytic foundations Analytic Research

Foundations for the Next Generation Electric Grid provide guidance on the longer term critical areas for research in mathematical and computational sciences that is needed for the next generation grid. It offers recommendations that are designed to help direct future research as the grid evolves and to give the nation's research and development infrastructure the tools it needs to effectively develop, test, and use this research. **Modern Power System Analysis** Turan

Curtailment Ouafa Laribi, 2022 The increasing integration of renewable energies is driving the transformation of the power grid in Germany. Renewable energy sources, which are mostly allocated in distribution grids, are replacing fossil power plants that are mostly applied in the transport grid. This shift to more renewable energies entails the expansion of the power transport capacities in the distribution grid. The conventional expansion of the power grid in Germany is, however, proceeding slowly due to the delay in the authorization procedures. Therefore, new solutions that enable a higher utilization of the existing grid must be adopted besides the classical grid expansion in order to achieve the planned energy transition goals.

This research work presents a new grid planning method which applies innovative technologies in addition to the conventional planning instruments with overhead lines and cables to optimize and expand the existing grid. The innovative planning instruments considered are battery storage systems and dynamic power curtailment. The proposed approach has been implemented in a time series based framework as an automated planning algorithm. Based on the selected planning instruments, the planning algorithm determines for a given distribution grid the tailored and most cost efficient measures to prevent prognosticated grid congestion.
