Microwave Circuits for 24 GHz Automotive Radar in Silicon-based Technologies Vadim Issakov, 2010-08-05 There are continuous efforts focussed on improving road traffic safety worldwide Numerous vehicle safety features have been invented and standardized over the past decades Particularly interesting are the driver assistance systems since these can considerably reduce the number of accidents by supporting drivers perception of their surroundings Many driver assistance features rely on radar based sensors Nowadays the commercially available automotive front end sensors are comprised of discrete components thus making the radar modules highly priced and suitable for integration only in premium class vehicles Realization of low cost radar front end circuits would enable their implementation in inexpensive economy cars considerably contributing to traffic safety Cost reduction requires high level integration of the microwave front end circuitry specifically analog and digital circuit blocks co located on a single chip Recent developments of silicon based technologies e.g CMOS and SiGe C bipolar make them suitable for realization of microwave sensors Additionally these technologies offer the necessary integration capability However the required output power and temperature stability necessary for automotive radar sensor products have not yet been achieved in standard digital CMOS technologies On the other hand SiGe bipolar technology offers excellent high frequency characteristics and necessary output power for automotive applications but has lower potential for realization of digital blocks than CMOS

Power Aware Computing Robert Graybill, Rami Melhem, 2013-04-17 With the advent of portable and autonomous computing systems power consumption has emerged as a focal point in many research projects commercial systems and DoD platforms One current research initiative which drew much attention to this area is the Power Aware Computing and Communications PAC C program sponsored by DARPA Many of the chapters in this book include results from work that have been supported by the PACIC program The performance of computer systems has been tremendously improving while the size and weight of such systems has been constantly shrinking The capacities of batteries relative to their sizes and weights has been also improving but at a rate which is much slower than the rate of improvement in computer performance and the rate of shrinking in computer sizes The relation between the power consumption of a computer system and its performance and size is a complex one which is very much dependent on the specific system and the

technology used to build that system We do not need a complex argument however to be convinced that energy and power which is the rate of energy consumption are becoming critical components in computer systems in general and portable and autonomous systems in particular Most of the early research on power consumption in computer systems addressed the issue of minimizing power in a given platform which usually translates into minimizing energy consumption and thus longer battery life
