Waltari, Kari A.I. Halonen, 2005-12-30 For four decades the evolution of integrated circuits has followed Moore s law according to which the number of transistors per square millimeter of silicon doubles every 18 months At the same time transistors have become faster making possible ever increasing clock rates in digital circuits This trend seems set to continue for at least another decade without slowing down Thus in the near future the processing power of digital circuits will continue to increase at an accelerating pace For analog circuits the evolution of technology is not as beneficial Thus there is a trend to move signal processing functions from the analog domain to the digital one which besides allowing for a higher level of accuracy provides savings in power consumption and silicon area increases robustness speeds up the design process brings flexibility and programmability and increases the possibilities for design reuse In many applications the input and output signals of the system are inherently analog preventing all digital realizations at the very least a conversion between analog and digital is needed at the terfaces Typically moving the analog

digital boundary closer to the outside world increases the bit rate across it In telecommunications systems the trend to boost bit rates is based on plying widerbandwidths and a higher signal to noise ratio At the same time radio architectures in many applications are evolving toward software defined radio one of the main characteristics of which is the shifting of the anal digital boundary closer to the antenna
