Technical Report, 1990 Vaccine Protocols Andrew P. Robinson, Martin P. Cranage, Michael J. Hudson, 2008-02-01
Vaccine research and development is advancing at an unprecedented pace with an increasing emphasis on rational design based upon a fundamental understanding of the underlying molecular mechanisms. The aim of this volume is to provide a selection of contemporary protocols that will be useful to both novice and advanced practitioner alike. The variety of procedures required to design, develop, produce and assess a vaccine is immense and covers aspects of chemistry, biochemistry, molecular biology, cell biology and immunology. No single volume can hope to cover these topics exclusively. Rather here we attempt to provide a methods sourcebook focusing on hands on practical advice. Complementary and background information may be found in other volumes in the *Methods in Molecular Medicine* series. Of particular interest are volumes on Dendritic Cell Protocols, Interleukin Protocols, Vaccine Adjuvants and DNA Vaccines. Since the publication of the first edition of *Vaccine Protocols* there have been major advances particularly in the areas of bacterial genomics, antigen specific T cell quantification, genetic manipulation of vaccine vectors, the harnessing of natural molecules concerned with the regulation of immune responses and the burgeoning field of DNA vaccinology. Hence the extensive revision of this edition with new chapters on live viral vaccine vectors, attenuated bacterial vectors, immunomodulators, MHC peptide tetrameric complexes and the identification of vaccine candidates by genomic analysis. Additionally chapters from the first edition have been updated to accommodate state of the art methods in vaccinology.
