The rapid development of optical fiber transmission technology has created the possibility for constructing digital networks that are as ubiquitous as the current voice network but which can carry video voice and data in massive quantities. How and when such networks will evolve, who will pay for them, and what new applications will use them is anyone's guess. There appears to be no doubt, however, that the trend in telecommunication networks is toward far greater transmission speeds and toward greater heterogeneity in the requirements of different applications. This book treats some of the central problems involved in these networks of the future. First, how does one switch data at speeds orders of magnitude faster than that of existing networks? This problem has roots in both classical switching for telephony and in switching for packet networks. There are a number of new twists here, however. The first is that the high speeds necessitate the use of highly parallel processing and place a high premium on computational simplicity. The second is that the required data speeds and allowable delays of different applications differ by many orders of magnitude. The third is that it might be desirable to support both point-to-point applications and also applications involving broadcast from one source to a large set of destinations.

**Principles of Broadband Switching and Networking** Soung C. Liew, Tony T. Lee,2010-03-02

An authoritative introduction to the roles of switching and transmission in broadband integrated services networks, *Principles of Broadband Switching and Networking* explains the design and analysis of switch architectures suitable for broadband integrated services networks, emphasizing packet-switched interconnection networks with distributed routing algorithms. The text examines the mathematical properties of these networks rather than specific implementation technologies. Although the pedagogical explanations in this book are in the context of switches, many of the fundamental principles are relevant to other communication networks with regular topologies. After explaining the concept of the modern broadband integrated services network and why it is necessary in today's society, the book moves on to basic switch design principles, discussing two types of circuit switch design: space domain and time domain, and packet switch design. Throughput improvements are illustrated by some switch design variations such as Speedup principle, Channel Grouping principle, Knockout principle, and Dilation principle. Moving seamlessly into advanced switch design principles, the book covers switch scalability, switch design for multicasting, and path switching. Then the focus moves to broadband communications networks that make use of such switches. Readers receive a detailed introduction on how to allocate network resources and control traffic to satisfy the quality of service requirements of network users and to maximize network usage. As an epilogue, the text shows how transmission noise and packet contention have similar characteristics and can be tamed by comparable means to achieve reliable communication. *Principles of Broadband Switching and Networking* is written for

senior undergraduate and first year postgraduate students with a solid background in probability theory      **Next**

Dynamic Routing in Broadband Networks focuses on routing in broadband networks based on MPLS Multiprotocol Label Switching and ATM Asynchronous Transfer Mode The routing methods are based on the theory of Markov decision processes

which forms a very accurate framework for on line route optimization The author shows the issue of performance optimization and scalability with respect to dynamic routing of logical connections in broadband networks The methods used are applicable to routing virtual path connections VPC and virtual channel connections VCC in ATM networks as well as label switched paths LSP in MPLS networks Simulation results and a performance comparison with reference routing are given for the different schemes *Opportunity for Innovation* Nist,1996-01-17 Multiwavelength Optical Networks Thomas E.
