Symmetrix Vmax 10k Series Product Guide:

An Introduction to Structural Optimization Peter W. Christensen, Anders Klarbring, 2008-10-20 This book has grown out of lectures and courses given at Linköping University Sweden over a period of 15 years. It gives an introductory treatment of problems and methods of structural optimization. The three basic classes of geometrical optimization problems of mechanical structures, i.e. size, shape and topology optimization, are treated. The focus is on concrete numerical solution methods for discrete and finite element discretized linear elastic structures. The style is explicit and practical; mathematical proofs are provided when arguments can be kept elementary but are otherwise only cited while implementation details are frequently provided. Moreover, since the text has an emphasis on geometrical design problems where the design is represented by continuously varying frequently very many variables, so-called first order methods are central to the treatment. These methods are based on sensitivity analysis, i.e. on establishing first order derivatives for objectives and constraints. The classical first order methods that we emphasize are CONLIN and MMA, which are based on explicit convex and separable approximations. It should be remarked that the classical and frequently used so-called optimality criteria method is also of this kind. It may also be noted in this context that zero order methods such as response surface methods, surrogate models, neural networks, genetic algorithms, etc. essentially apply to different types of problems than the ones treated here and should be presented elsewhere.

Numerical Simulation of Oscillatory Convection in Low-Pr Fluids Bernard Roux, 2013-03-08 For the last ten years there has been an ever increasing awareness that fluid motion and transport processes influenced by buoyancy are of interest in many fields of science and technology. In particular, a lot of research has been devoted to the oscillatory behaviour of metallic melts, low Pr fluids, due to the very crucial impact of such flow oscillations on the quality of growing crystals, semiconductors or metallic alloys for advanced technology applications. Test cases on the 2D oscillatory convection in differentially heated cavities containing low Pr fluids have been defined by the organizing committee and proposed to the community in 1987. The GAMM Workshop was attended by 55 scientists from 12 countries in Oct 1988 in Marseille, France. Twenty-eight groups contributed to the mandatory cases coming from France, 12 other European countries, 7 and other countries, USA, Japan and Australia, 9. Several groups also presented solutions of various related problems such as accurate determination of the threshold for the onset of oscillations, thermocapillary effect in open cavities and 3D simulations. Period doubling, quasi-periodic behaviour, reverse transition and hysteresis loops have been reported for high Grashof numbers in closed cavities. The workshop was also open to complementary contributions, 5 from experiments and theory, stability and bifurcation analysis. The book contains details about the various methods employed and the specific results obtained by each contributor.
