**University Curricula in the Marine Sciences and Related Fields**, 1973      **Advances in Ocean Exploration** Adam Soule, Daniel Wagner, Aurora Elmore, Leila J. Hamdan, 2024-09-20 The ocean covers more than 70% of the Earth's surface and encompasses 99% of its habitable volume yet is largely unexplored. However, new technologies, approaches, and a growing recognition of the ocean's role in sustaining the health, wealth, and security of modern society has spurred a rapid acceleration in ocean exploration and discovery. Past ocean exploration efforts have fundamentally impacted our view of the bounds of life on the planet, the human-ocean relationship, and the Earth's inner workings, and many more discoveries yet remain. The varied stakeholders for ocean exploration are exemplified in many of the UN Ocean Decade challenges that require generating baseline knowledge to expose ocean regions and processes not yet constrained. As more of the deep ocean is explored, we gain important insight into scientifically and societally relevant questions, including the distribution of ocean organisms and ecosystems, seafloor mineralization, chemical cycling, and the role of the oceans in global climate. Ocean exploration benefits from deep integration across disciplinary boundaries and careful coordination between stakeholders and explorers. This volume brings together scientists, engineers, and educators across disciplinary boundaries towards the common goal of mapping and characterizing unknown parts of the ocean. To meet the tremendous challenge of exploring the world's oceans will require the incorporation of new technologies and approaches that enhance the efficiency of exploration, adopt the latest developments in autonomy, and recognize the value of ocean exploration for society's benefit. This current topic provides an overview of the latest data, results, and innovations, along with an assessment of the current gaps in ocean exploration in order to focus the community's efforts and enhance the spread of current innovations. We invite contributions that describe advances in ocean exploration, including but not limited to: Assessments of and novel approaches to identifying exploration gaps and targets; Descriptions of novel vehicle systems that utilize autonomy and artificial intelligence to enhance ocean exploration; Development of new sensors and samplers that offer opportunities for scaling up ocean exploration and minimizing impact to ocean environments; Approaches to accessing difficult-to-reach and challenging subsea environments for exploration; The synergies of combining uncrewed systems with human expertise; New methods for analyzing and interpreting ocean data that create new scientific outcomes and enhance data use; Approaches to engaging a more diverse ocean exploration community, including the indigenous communities adjacent to ocean exploration targets; Evaluations of ocean exploration impact on issues of high societal relevance.      Demonstrating Observation Impacts for the Ocean and Coupled Prediction Yosuke Fujii, Peter R. Oke, Elisabeth Remy, 2025-04-25 Capabilities in ocean data assimilation developed over a decade-long project called the Global Ocean Data Assimilation Experiment (GODAE). By the end of GODAE, many countries had established operational ocean forecast systems and mature ocean reanalysis systems. These developments further improved under OceanPredict and are now being extended under several Programs and Projects under the United

Nations Ocean Decade including ForeSea SynObs and CoastPredict This Research Topic is intended to showcase the activities being performed under these projects all of which share a common goal of predicting our environment to benefit society      **Scientific and Technical Aerospace Reports** ,1993      **Special Bibliographies on Oceanography** ,1965

**Physical Oceanography Processes at Eastern Boundary Upwelling Systems** Francisco Machin,Jose Gomez-Valdes,2023-12-29 Eastern boundary upwelling systems EBUS have historically received attention from the scientific community due to their impact on the economic development of these highly productive systems Remote sensing numerical modeling and in situ observations have increased their spatial and temporal resolutions during the last 40 years in their strategy to provide reliable products about the actual state of the ocean The assembly of several data sources currently constitutes an opportunity to increase our knowledge about the present and future state of the relatively narrow and highly variable EBUS The primary forcing mechanism in the upwelling regions is the wind stress in areas close to the coast Long term trends in wind intensity in upwelling areas present considerable uncertainties as the different wind databases produce divergent results On the other hand although the effect of climate change in the interior ocean is increasing temperatures in upwelling areas the long term trends seem to be in the opposite direction Hence assessing the long term impact of the environmental conditions on upwelling development represents a major challenge for the scientific community This special issue aims to discuss the state of the art understanding of dynamical processes governing the ocean at the eastern boundary upwelling systems in a changing ocean      **College of Engineering** University of Michigan.
