

## Recombinant DNA Paper Plasmid Lab

This packet next book, as defined, the following names in your lab notebook.

recombinant DNA  
genetic engineering  
restriction enzyme  
plasmid

### Background Information

Recombinant DNA technology is one of the new techniques of biotechnology. Biotechnology uses living organisms to make new chemical processes or to produce substances, combining biology with chemistry and science with industry. Biotechnology includes the field of **genetic engineering**, which is the science of directly manipulating genes to produce recombinant DNA. Genetic engineering techniques are used in a variety of industries, in agriculture, in basic research, and in medicine.

Through genetic engineering, there is great potential for the development of useful products. Researchers have already developed vaccines of measles, human growth hormone, insulin, and interferon (an antiviral). A gene coding for a particular protein is inserted into a host organism. The host organism reproduces and the population produces the desired protein in volume. For example, the gene that codes for the production of human insulin has been inserted into the common bacterium *E. coli*. Then the bacteria can be grown in large numbers and large amounts of insulin can be collected.

In an introduction to recombinant DNA technology, the exercise that follows illustrates on paper some of the steps of recombinant DNA experiments done in laboratory.
