I. Title: Identification of an Impure Unknown Using Recrystallization and Mixed Melting Point Experiment

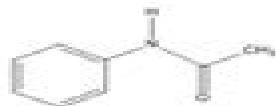

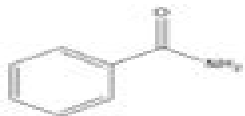

II. Introduction:

The lab consists of using the recrystallization process which purifies organic solid compounds. The goal is to dissolve and subsequently crystallize a pure substance from the solution to identify an unknown. The purpose of the experiment will be to purify an impure sample of an unknown organic compound through recrystallization and identify the unknown by establishing its melting point. Recrystallization will allow for an effective way of obtaining a pure sample. There will be five steps of recrystallization used in the lab:

1. Choosing an appropriate solvent for the recrystallization
2. Dissolving the impure mixture in the hot solvent
3. Removing the insoluble impurities from the hot solvent via filtration
4. Cooling to crystallize the pure compound from the solution
5. Isolating the pure compound via suction filtration

The melting point of a chemical substance is the temperature at which its solid and liquid phases are in equilibrium. The mixed melting point experiment will determine the melting point of the unknown solid to verify the identity of the unknown compound.

components with specialized properties allows one to tailor the end product's properties. For instance, the sensitivity, burning behavior, thermal or mechanical properties, or stability of energetic materials can be affected and even controllably varied through incorporation of such ingredients. This book examines particle technologies as applied to energetic materials such as propellants and explosives, thus filling a void in the literature on this subject. Following an introduction covering general features of energetic materials, the first section of this book describes methods of manufacturing particulate energetic materials, including size reduction, crystallization, atomization, particle formation using supercritical fluids, and microencapsulation. Agglomeration phenomena, special considerations in mixing explosive particles, and the production of nanoparticles are also discussed. The second section discusses the characterization of particulate materials. Techniques and methods such as particle size analysis, morphology elucidation, and the determination of chemical and thermal properties are presented. The wettability of powders and rheological behavior of suspensions and solids are also considered. Furthermore, methods of determining the performance of particular energetic materials are described. Each chapter deals with fundamentals and application possibilities of the various methods presented, with particular emphasis on issues applicable to particulate energetic materials. The book is thus equally relevant for chemists, physicists, material scientists, chemical and mechanical engineers, and anyone interested or engaged in particle processing and characterization technologies.

This comprehensive lab companion provides enough theory to help students understand how and why an operation works but emphasizes the practical aspects of an operation to help them perform the operation successfully in the lab. For undergraduate or graduate students taking organic chemistry lab, this comprehensive lab companion provides enough theory to help students understand how and why an operation works but emphasizes the practical aspects of an operation to help them perform the operation successfully in the lab. The Second Edition makes substantive revisions of many operations to clarify existing material and add new information. More environmentally friendly, i.e., green lab experiments are encouraged. Ideal for professors who write their own lab experiments or would like custom labs but need a source for lab operations and safety information.
