Committee **Data Storage for Social Networks** Duc A. Tran,2012-08-15 Evidenced by the success of Facebook Twitter
and LinkedIn online social networks OSNs have become ubiquitous offering novel ways for people to access information and
communicate with each other As the increasing popularity of social networking is undeniable scalability is an important issue

for any OSN that wants to serve a large number of users Storing user data for the entire network on a single server can quickly lead to a bottleneck and consequently more servers are needed to expand storage capacity and lower data request traffic per server Adding more servers is just one step to address scalability The next step is to determine how best to store the data across multiple servers This problem has been widely studied in the literature of distributed and database systems OSNs however represent a different class of data systems When a user spends time on a social network the data mostly requested is her own and that of her friends e g in Facebook or Twitter these data are the status updates posted by herself as well as that posted by the friends This so called social locality should be taken into account when determining the server locations to store these data so that when a user issues a read request all its relevant data can be returned quickly and efficiently Social locality is not a design factor in traditional storage systems where data requests are always processed independently Even for today's OSNs social locality is not yet considered in their data partition schemes These schemes rely on distributed hash tables DHT using consistent hashing to assign the users data to the servers The random nature of DHT leads to weak social locality which has been shown to result in poor performance under heavy request loads Data Storage for Social Networks A Socially Aware Approach is aimed at reviewing the current literature of data storage for online social networks and discussing new methods that take into account social awareness in designing efficient data storage

Distributed Storage Networks Thomas C. Jepsen, 2013-05-28 The worldwide market for SAN and NAS storage is anticipated to grow from US 2 billion in 1999 to over 25 billion by 2004 As business to business and business to consumer e commerce matures even greater demands for management of stored data will arise With the rapid increase in data storage requirements in the last decade efficient management of stored data becomes a necessity for the enterprise A recent UC Berkeley study predicts that 150 000 terabytes of disk storage will be shipped in 2003 Most financial insurance healthcare and telecommunications institutions are in the process of implementing storage networks that are distributed to some degree For these institutions data integrity is critical and they will spend much time and money on planning One of the primary obstacles to implementing a storage network cited by enterprise IT managers is a lack of knowledge about storage networking technology and the specific issues involved in extending a Storage Area Network SAN or Network Attached Storage NAS over the Metropolitan Area Networks MAN or Wireless Area Networks WAN Distributed Storage Networks Architecture Protocols and Management addresses the terminology gap between enterprise network planners and telecommunications engineers who must understand the transport requirements of storage networks in order to implement distributed storage networks Jepsen comprehensively provides IT managers planners and telecommunications professionals with the information they need in order to choose the technologies best suited for their particular environment Addresses a hot topic that will become increasingly important in the coming years Enables high level managers and planners to make intelligent decisions about network needs Includes example network configurations providing solutions to typical user
