Vibration and Wave Fundamentals — continued

5. A machine gun fires 10 rounds per second.  
The speed of the bullets is 300 m/s.

speed (1)  
 $300 (1/10) = 30m$

- a. What is the distance in the air between the flying bullets? 30m  
b. What happens to the distance between the bullets if the rate of fire is increased?

distance would decrease

6. Consider a wave generator that produces 10 pulses per second. The speed of the waves is 300 cm/s.

- a. What is the wavelength of the waves? \_\_\_\_\_  
b. What happens to the wavelength if the frequency of pulses is increased?

7. The bird at the right watches the waves. If the portion of a wave between 2 crests passes the pole each second,

- a. what is the speed of the waves? \_\_\_\_\_  
b. what is the period of wave motion? \_\_\_\_\_  
c. If the distance between crests were 1.5 meters apart, and 2 crests pass the pole each second, what would be the speed of the wave?

- d. What would the period of wave motion be for 7 c ?  
\_\_\_\_\_

8. When an automobile moves toward a listener, the sound of its horn seems relatively

[low pitched] [high pitched] [normal]

and when moving away from the listener, its horn seems

[low pitched] [high pitched] [normal]

9. The changed pitch of the Doppler effect is due to changes in wave

**Insights 'O' Level** Wan Yong Loo, 2007     Communication Acoustics Ville Pulkki, Matti Karjalainen, 2015-04-30 In  
 communication acoustics the communication channel consists of a sound source a channel acoustic and or electric and finally  
 the receiver the human auditory system a complex and intricate system that shapes the way sound is heard Thus when  
 developing techniques in communication acoustics such as in speech audio and aided hearing it is important to understand  
 the time frequency space resolution of hearing This book facilitates the reader's understanding and development of speech  
 and audio techniques based on our knowledge of the auditory perceptual mechanisms by introducing the physical signal  
 processing and psychophysical background to communication acoustics It then provides a detailed explanation of sound  
 technologies where a human listener is involved including audio and speech techniques sound quality measurement hearing  
 aids and audiology Key features Explains perceptually based audio the authors take a detailed but accessible engineering  
 perspective on sound and hearing with a focus on the human place in the audio communications signal chain from  
 psychoacoustics and audiology to optimizing digital signal processing for human listening Presents a wide overview of speech  
 from the human production of speech sounds and basics of phonetics to major speech technologies recognition and synthesis  
 of speech and methods for speech quality evaluation Includes MATLAB examples that serve as an excellent basis for the  
 reader's own investigations into communication acoustics interaction schemes which intuitively combine touch vision and  
 voice for lifelike interactions     *Digital Sound Synthesis by Physical Modeling Using the Functional Transformation Method*  
 Lutz Trautmann, Rudolf Rabenstein, 2012-12-06 This book considers signal processing and physical modeling meth ods for  
 sound synthesis Such methods are useful for example in mu sic synthesizers computer sound cards and computer games  
 Physical modeling synthesis has been commercialized for the first time about 10 years ago Recently it has been one of the  
 most active research topics in musical acoustics and computer music The authors of this book Dr Lutz Trautmann and Dr  
 Rudolf Rabenstein are active researchers and inventors in the field of sound synthesis Together they have developed a new  
 synthesis technique called the functional transformation method which can be used for pro ducing musical sound in real time  
 Before this book they have published over 20 papers on the topic in journals and conference proceedings In this excellent  
 textbook the results are combined in a single volume I believe that this will be considered an important step forward for the

re envisions how we think about sound music and listening Eidsheim shows how sound music and listening are dynamic and contextually dependent rather than being fixed knowable and constant She uses twenty first century operas by Juliana Snapper Meredith Monk Christopher Cerrone and Alba Triana as case studies to challenge common assumptions about sound such as air being the default medium through which it travels and to demonstrate the importance a performance's location and reception play in its contingency By theorizing the voice as an object of knowledge and rejecting the notion of an a priori definition of sound Eidsheim releases the voice from a constraining set of fixed concepts and meanings In Eidsheim's theory music consists of aural tactile spatial physical material and vibrational sensations This expanded definition of music as manifested through material and personal relations suggests that we are all connected to each other in and through sound Sensing Sound will appeal to readers interested in sound studies new musicology contemporary opera and performance studies
