*Australia's Biodiversity and Climate Change* Will Steffen, Andrew A. Burbidge, Lesley Hughes, Roger Kitching, David Lindenmayer, Warren Musgrave, Mark Stafford Smith, Patricia A. Werner, 2009 Australia's unique biodiversity is under threat from a rapidly changing climate The effects of climate change are already discernible at all levels of biodiversity genes species communities and ecosystems Many of Australia's most valued and iconic natural areas the Great Barrier Reef south western Australia the Kakadu wetlands and the Australian Alps are among the most vulnerable But much more is at stake than saving iconic species or ecosystems Australia's biodiversity is fundamental to the country's national identity economy and quality of life In the face of uncertainty about specific climate scenarios ecological and management principles provide a sound basis for maximising opportunities for species to adapt communities to reorganise and ecosystems to transform while maintaining basic functions critical to human society This innovative approach to biodiversity conservation under a changing climate leads to new challenges for management policy development and institutional design This book explores these challenges building on a detailed analysis of the interactions between a changing climate and Australia's rich but threatened biodiversity Australia's Biodiversity and Climate Change is an important reference for policy makers researchers educators students journalists environmental and conservation NGOs NRM managers and private landholders with an interest in biodiversity conservation in a rapidly changing world Publisher

economic sectors such as fisheries agriculture coastal zone management coastal protection urban climate recreation tourism offshore activities energy and air pollution

**Valuing Climate Change** Samuel Fankhauser, 2013-10-11 Within only a few years global warming has emerged from scientific speculation into an environmental threat of worldwide concern Yet the scientific community remains uncertain as to the long term trends and effects of climate change and this uncertainty has been seized on as justification for inaction by an international community reluctant to bear the costs of policies to reduce greenhouse gas emissions Valuing Climate Change presents concrete economic evidence of the need for action Fankhauser assesses the costs of a doubling of GHG emissions to be a significant percentage of gross world product a figure which he then compares to the costs of reducing emissions In his comparison he looks at regional as well as global estimates of damage and takes account of the non climate change benefits of GHG reductions such as a switch in the energy sector to cleaner technologies or renewable fuels and the impacts on transport with reduced congestion and improved air quality It is clear that the stakes are high and Fankhauser believes that tougher targets may be needed than those set out in the Framework Convention on Climate Change He assesses the optimum policy responses to GHG reduction the likely instruments for achieving it and the potential for international cooperation in dealing with the problems This is a major contribution to the rapidly changing debate on global warming

An Introduction to the Green Economy Adrian C. Newton, Elena Cantarello, 2014-08-13 The green economy is widely seen as a potential solution to current global economic and environmental crises and a potential mechanism by which sustainable development might be achieved in practice Considerable investments are now being made into the development of green technology renewable energy biodiversity conservation resource efficiency recycling of materials and green infrastructure This textbook provides a comprehensive introduction to the green economy using a strongly interdisciplinary approach based on environmental science rather than treating it as a sub set of economics The scientific principles of sustainability are presented which provide the foundations of the green economy with a particular focus on systems based approaches Examples of real world case studies are used to illustrate how the green economy can be achieved in practice In this way the authors provide a thorough overview of both the principles and practice of the green economy drawing from a wide range of disciplines including ecology geography social science psychology sustainability science environmental science law and economics The emphasis is on presenting results of the latest research derived from leading scientific journals Rather than focusing on a single definition of what constitutes a green economy the book introduces readers to the diversity of opinion that exists and engages them in what is an active on going debate This reflects the fact that many aspects of the green economy and sustainable development more generally are currently contested In particular the book will help readers to strengthen their ability to critically evaluate the evidence for and against the views presented and to actively contribute to the future development of the green economy

*Technologies for Green House Gas Assessment in Crop Studies* Dinesh Chandra Uprety, Pallavi Saxena, 2021-04-01 Global climate change is one of the most serious threats to the environment of the earth and to the crop production Crop's vulnerability to climate change stress caused by the greenhouse gases emission is a serious concern This book describes various technologies and methods including the simulation of the future climate changes studying the response of crop plants and characterizing their responses physiologically and biochemically It includes the latest information of protocols and technologies for climate change research on agriculture This book is of interest to teachers researchers climate change scientists capacity builders and policymakers Also the book serves as additional reading material for undergraduate and graduate students of agriculture forestry ecology soil science and environmental sciences National and international agricultural scientists policy makers will also find this to be a useful read      Environmental Change and Globalization Robin Leichenko, Karen O'Brien, 2008-09-25 This work explores the connections between two of the most transformative processes of the 21st century global environmental change and globalization It presents a conceptual framework for analyzing the interactions between these two processes      Asian Change in the Context of Global Climate Change James Galloway, Jerry Melillo, 1998-09-28 Nearly two thirds of the world's population live in Asia and many countries in that region are currently undergoing very rapid industrial agricultural and economic development The Framework Convention on Climate Change constrains developed countries with regard to their future emissions of greenhouse gases but recognizes the special needs of developing countries There is growing appreciation of the ways in which developing countries in the Asian region both contribute to global changes by altering biogeochemical pathways and cycles and are themselves affected by those changes This volume uses the intellectual efforts and findings of the International Geosphere Biosphere Programme IGBP community to provide the first integrated analysis of the interactions between global change and Asian change giving particular attention to China's role The book will be of interest to readers in a wide range of academic disciplines natural sciences and socio economic and for those involved in national and international policy development relevant to global change

**Climate Change Biology**, 2011 Climate change has moved from being a contested phenomenon to the top of the agenda at global summits Climate Change Biology is the first major textbook to address the critical issue of how climate change may affect life on the planet and particularly its impact on human populations Presented in four parts the first deals extensively with the physical evidence of climate change and various modelling efforts to predict its future Biological responses are addressed in the second part from the individual s physiology to populations and ecosystems and further to considering adaptation and evolution The third part examines the specific impact climate change may have on natural resources agriculture and forestry The final part considers research on the cutting edge of impact prediction and the practical and philosophical limitations on our abilities to predict these impacts This text will be a useful asset to the growing number of both undergraduate and graduate courses on impacts of climate change as well as providing a succinct overview for researchers new to the field

**Crop Adaptation to Climate Change** Shyam Singh Yadav, Robert J. Redden, Jerry L. Hatfield, Hermann Lotze-Campen, Anthony E. Hall, 2011-08-02 A major task of our time is to ensure adequate food supplies for the world s current population now nearing 7 billion in a sustainable way while protecting the vital functions and biological diversity of the global environment The task of providing for a growing population is likely to be even more difficult in view of actual and potential changes in climatic conditions due to global warming and as the population continues to grow Current projections suggest that the world s temperatures will rise 1.8-4.0 by 2100 and population may reach 8 billion by the year 2025 and some 9 billion by mid century after which it may stabilize This book addresses these critical issues by presenting the science needed not only to understand climate change effects on crops but also to adapt current agricultural systems particularly in regard to genetics to the changing conditions Crop Adaptation to Climate Change covers a spectrum of issues related to both crops and climatic conditions The first two sections provide a foundation on the factors involved in climate stress assessing current climate change by region and covering crop physiological responses to these changes The third and final section contains chapters focused on specific crops and the current research to improve their genetic adaptation to climate change Written by an international team of authors Crop Adaptation to Climate Change is a timely look at the potentially serious consequences of climate change for our global food supply and is an essential resource

for academics researchers and professionals in the fields of crop science agronomy plant physiology and molecular biology crop consultants and breeders as well as climate and food scientists

**The Natural Fix?** Kate Trumper,United Nations Environment Programme,2009 The report describes the vital contribution that ecosystems can and must make in our efforts to cut very large emissions of greenhouse gases that are needed if we are to avoid the worst effects of global climate change Vigorous efforts are needed to decrease carbon dioxide concentration in the atmosphere and doing so will be impossible without addressing carbon losses from ecosystems such as forests and peatlands Managing ecosystems for carbon can not only reduce carbon emissions it can also actively remove carbon dioxide from the atmosphere Restoring some of the large amounts of carbon lost from agricultural soils and drylands has the greatest potential here Publisher s description
