1. The first step in the process of creating a new product is to identify a market need. This involves conducting market research to understand the target audience's preferences and pain points. Once a need is identified, the next step is to develop a concept that addresses this need. This concept should be innovative and differentiated from existing products in the market.

2. After developing a concept, the next step is to create a prototype. This allows the development team to visualize the product and test its functionality. Prototyping can be done using various methods, such as 3D printing, CAD, or even hand-drawn sketches. The prototype is used to gather feedback from potential users and make necessary adjustments.

3. Once the prototype is refined, the next step is to conduct a feasibility study. This study evaluates the technical, financial, and market viability of the product. It involves assessing the resources required for production, the potential costs, and the competitive landscape. This step is crucial to ensure that the product is not only innovative but also commercially viable.

4. Following the feasibility study, the next step is to develop a business plan. This plan outlines the marketing strategy, distribution channels, and financial projections. It serves as a roadmap for the product's launch and growth. The business plan should also include a timeline for development and a clear definition of the product's unique value proposition.

5. The final step in the process is to launch the product. This involves manufacturing the product at scale and distributing it to the market. Launching a new product is a significant milestone, and it requires careful planning and execution. The development team should monitor the product's performance in the market and be prepared to make adjustments as needed.

Under 400 ppm, the RDM will start injecting fluid (acetone) as soon as the CV module receives a run signal, preheats the spark and produces a reference signal for the RDM to calculate the fuel injection. The CV module controls the spark plug timing. After 400 ppm, the RDM takes over the timing. After 450 ppm, the RDM sends Electronic Spark Timing (EST) and changes its role of fuel injection to supplemental, providing a lean boost as needed.
