cell compartment The stress responses of the body summarily drive up this compartment and have led to a world wide prevalence of between 14% to 17% of mast cell activation syndrome While genetics and comorbid conditions are important in any symptom or disease process the mast cell compartment feeds and grows off all the major environmental changes of the past 50 or so years This is why the human body in the 21st century is in a low level state of rejection of the world says the author Most of these changes are irreversible but the situation is not hopeless Understanding how the body changes itself in response to its environment will allow controlled desensitization to the environment Allergic to Life How the Human Body Rejects the Modern World serves as a concise and lively text for clinicians and general readers interested in a deep expert dive into the world of allergy and immunology
