This new edition captures the extraordinary recent advances in our knowledge of the ultimate and proximal mechanisms underlying the phenomenon of aging. As a result, six important conceptual changes are included here: Clarified distinctions between the biological mechanisms involved in longevity determination and those involved in senescent processes; A new conceptual framework around which we can organize all the new facts about aging; This will assist readers to make sense of the information and use the data to form their own ideas; Increased knowledge of aging cells has led to new ideas on how a cell transits from a healthy state to a senescent state while still allowing for high levels of intra and inter-specific variability; Discussion of senescent mechanisms assists the reader to understand that aging is a non-programmatic loss of function likely arising from the loss of regulatory signals and so is modifiable in the laboratory; Because the standard evolutionary story does not fully explain the evolution of social organisms, this edition also includes recent work dealing with intergenerational resource transfers. Lastly, if aging mechanisms are plastic, then the demand to move these anti-aging interventions into the human arena will inevitably grow. A discussion of the biological and ethical arguments on both sides of the question frames the question in an appropriate manner. The mass of data related to aging is summarized into fifteen focused chapters, each dealing with some particular aspect of the problem. The last two chapters integrate all this material into a coherent view of how the relevant biological processes change over the life span. This view is expressed in two non-technical figures you might say that the whole book exists to fully support Figs 9, 4, 14, 9 whose meanings are elucidated as the reader progresses through the book.
